

1 TMS320F2802x (Piccolo™) MCUs

1.1 Features

- **High-Efficiency 32-Bit CPU (TMS320C28x™)**
 - 60 MHz (16.67-ns Cycle Time)
 - 40 MHz (25-ns Cycle Time)
 - 16 x 16 and 32 x 32 MAC Operations
 - 16 x 16 Dual MAC
 - Harvard Bus Architecture
 - Atomic Operations
 - Fast Interrupt Response and Processing
 - Unified Memory Programming Model
 - Code-Efficient (in C/C++ and Assembly)
- **Low Device and System Cost:**
 - Single 3.3-V Supply
 - No Power Sequencing Requirement
 - Integrated Power-on Reset and Brown-out Reset
 - Small Packaging, as low as 38-pin available
 - Low Power
 - No Analog Support Pins
- **Clocking:**
 - 2 Internal Zero-pin Oscillators
 - On-chip Crystal Oscillator/External Clock Input
 - Dynamic PLL Ratio Changes Supported
 - Watchdog Timer Module
 - Missing Clock Detection Circuitry
- **Up to 22 Individually Programmable,**
 - **Multiplexed GPIO Pins With Input Filtering**
 - **Peripheral Interrupt Expansion (PIE) Block That Supports All Peripheral Interrupts**
 - **Three 32-Bit CPU Timers**
 - **On-Chip Memory**
 - Flash, SARAM, OTP, Boot ROM Available
 - **128-Bit Security Key/Lock**
 - Protects Secure Memory Blocks
 - Prevents Firmware Reverse Engineering
 - **Serial Port Peripherals**
 - One SCI (UART) Module
 - One SPI Module
 - One Inter-Integrated-Circuit (I2C) Bus
 - **Advanced Emulation Features**
 - Analysis and Breakpoint Functions
 - Real-Time Debug via Hardware
 - **Enhanced Control Peripherals**
 - Enhanced Pulse Width Modulator (ePWM)
 - High-resolution PWM (HRPWM)
 - Enhanced Capture (eCAP)
 - Analog-to-Digital Converter (ADC)
 - Comparator
 - **2802x Packages**
 - 38-Pin DA Plastic Small Outline Package (PSOP)
 - 48-Pin PT Plastic Quad Flatpack (PQFP)

1.2 Description

The F2802x Piccolo™ family of microcontrollers provides the power of the C28x™ core coupled with highly integrated control peripherals in low pin-count devices. This family is code compatible with previous C28-based code, as well as providing a high level of analog integration.

An internal voltage regulator allows for single rail operation. Enhancements have been made to the HRPWM module to allow for dual-edge control (frequency modulation). Analog comparators with internal 10-bit references have been added and can be routed directly to control the PWM outputs. The ADC converts from 0 to 3.3-V fixed full scale range and supports ratio-metric V_{REFHI}/V_{REFLO} references. The interface has been optimized for low overhead/latency.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this document.

Piccolo, TMS320C28x, C28x, TMS320C2000, Code Composer Studio, XDS510 are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

1.3 Getting Started

This section gives a brief overview of the steps to take when first developing for a C28x device. For more detail on each of these steps, see the following:

- *Getting Started With TMS320C28x™ Digital Signal Controllers* (literature number [SPRAAM0](#)).
- [C2000 Getting Started Website \(http://www.ti.com/c2000getstarted\)](http://www.ti.com/c2000getstarted)
- TMS320F28x MCU Development and Experimenter's Kits (<http://www.ti.com/f28xkits>)

- (1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* ([SPRU566](#)) and in the peripheral reference guides.
- (2) See [Section 5.1](#), Device and Development Support Nomenclature for descriptions of device stages. TMX is an experimental device that is not necessarily representative of the final device's electrical specifications. TMS is a fully qualified production device.

2.1 Pin Assignments

Figure 2-1 shows the 48-pin PT plastic quad flatpack (PQFP) pin assignments. Figure 2-2 shows the 38-pin DA plastic small outline package (PSOP) pin assignments.

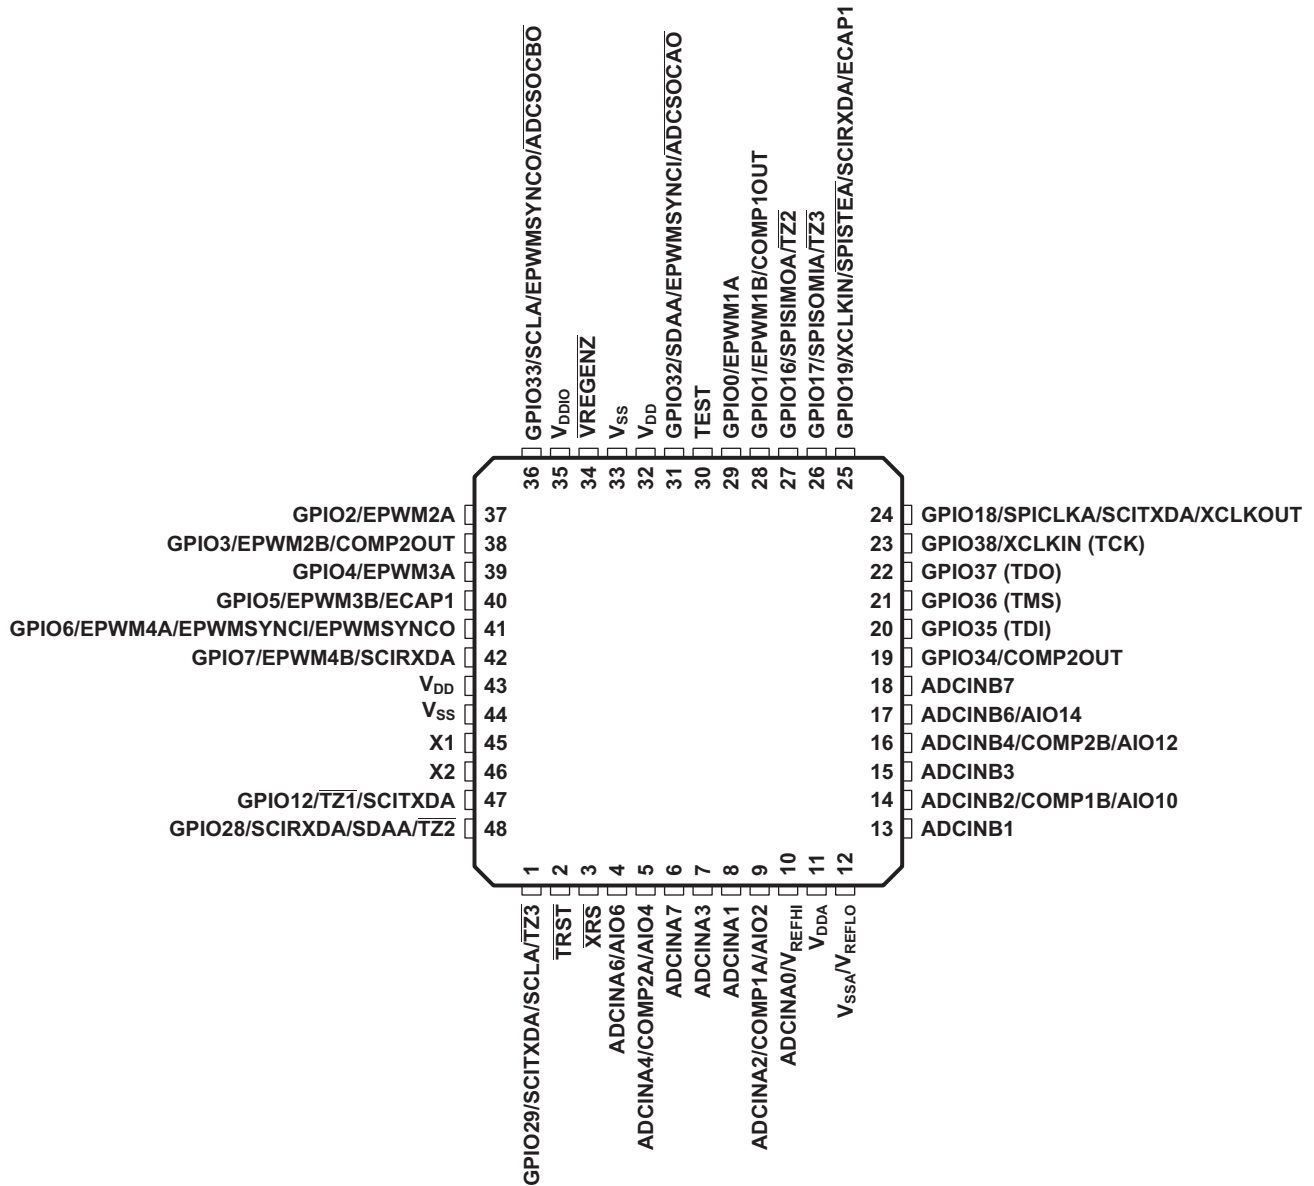

Figure 2-1. 2802x 48-Pin PT PQFP (top view)

Figure 2-2. 2802x 38-Pin DA PSOP (top view)

2.2 Signal Descriptions

Table 2-2. TERMINAL FUNCTIONS

| TERMINAL | | | I/O/Z | DESCRIPTION |
|--------------------------|-----------------------|--------|-------|---|
| NAME | PT NO. | DA NO. | | |
| JTAG | | | | |
| $\overline{\text{TRST}}$ | 2 | 16 | I | JTAG test reset with internal pulldown. $\overline{\text{TRST}}$, when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored. NOTE: $\overline{\text{TRST}}$ is an active high test pin and must be maintained low at all times during normal device operation. An external pulldown resistor is recommended on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k Ω resistor generally offers adequate protection. Since this is application-specific, it is recommended that each target board be validated for proper operation of the debugger and the application. (\downarrow) |
| TCK | See GPIO38 | | I | See GPIO38. JTAG test clock with internal pullup (\uparrow) |
| TMS | See GPIO36 | | I | See GPIO36. JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK. (\uparrow) |
| TDI | See GPIO35 | | I | See GPIO35. JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. (\uparrow) |
| TDO | See GPIO37 | | O/Z | See GPIO37. JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. (8 mA drive) |
| FLASH | | | | |
| TEST | 30 | 38 | I/O | Test Pin. Reserved for TI. Must be left unconnected. |
| CLOCK | | | | |
| XCLKOUT | See GPIO18 | | O/Z | See GPIO18. Output clock derived from SYSCLKOUT. XCLKOUT is either the same frequency, one-half the frequency, or one-fourth the frequency of SYSCLKOUT. This is controlled by bits 1:0 (XCLKOUTDIV) in the XCLK register. At reset, XCLKOUT = SYSCLKOUT/4. The XCLKOUT signal can be turned off by setting XCLKOUTDIV to 3. The mux control for GPIO18 must also be set to XCLKOUT for this signal to propagate to the pin. |
| XCLKIN | See GPIO19 and GPIO38 | | I | See GPIO19 and GPIO38. External oscillator input. Pin source for the clock is controlled by the XCLKINSEL bit in the XCLK register, GPIO38 is the default selection. This pin feeds a clock from an external 3.3-V oscillator. In this case, the X1 pin, if available, must be tied to GND and the on-chip crystal oscillator must be disabled via bit 14 in the CLKCTL register. If a crystal/resonator is used, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. Note: Designs that use the GPIO38/TCK/XCLKIN pin to supply an external clock for normal device operation may need to incorporate some hooks to disable this path during debug using the JTAG connector. This is to prevent contention with the TCK signal, which is active during JTAG debug sessions. The zero-pin internal oscillators may be used during this time to clock the device. |
| X1 | 45 | – | I | On-chip crystal oscillator Input. To use this oscillator, a quartz crystal or a ceramic resonator must be connected across X1 and X2. In this case, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. If this pin is not used, it must be tied to GND. (I) |
| X2 | 46 | – | O | On-chip crystal oscillator output. A quartz crystal or a ceramic resonator must be connected across X1 and X2. If X2 is not used, it must be left unconnected. (O) |

Table 2-2. TERMINAL FUNCTIONS (continued)

| TERMINAL | | | I/O/Z | DESCRIPTION |
|---|--------|--------|---------------|--|
| NAME | PT NO. | DA NO. | | |
| RESET | | | | |
| $\overline{\text{XRS}}$ | 3 | 17 | I/O | Device Reset (in) and Watchdog Reset (out). Piccolo devices have a built-in power-on-reset (POR) and brown-out-reset (BOR) circuitry. As such, no external circuitry is needed to generate a reset pulse. During a power-on or brown-out condition, this pin is driven low by the device. See the electrical section for thresholds of the POR/BOR block. This pin is also driven low by the MCU when a watchdog reset occurs. During watchdog reset, the $\overline{\text{XRS}}$ pin is driven low for the watchdog reset duration of 512 OSCCLK cycles. If need be, an external circuitry may also drive this pin to assert a device reset. In this case, it is recommended that this pin be driven by an open-drain device. An R-C circuit must be connected to this pin for noise immunity reasons. Regardless of the source, a device reset causes the device to terminate execution. The program counter points to the address contained at the location 0x3FFFC0. When reset is deactivated, execution begins at the location designated by the program counter. The output buffer of this pin is an open-drain with an internal pullup. (I/OD) |

3 Functional Overview

3.1 Block Diagram

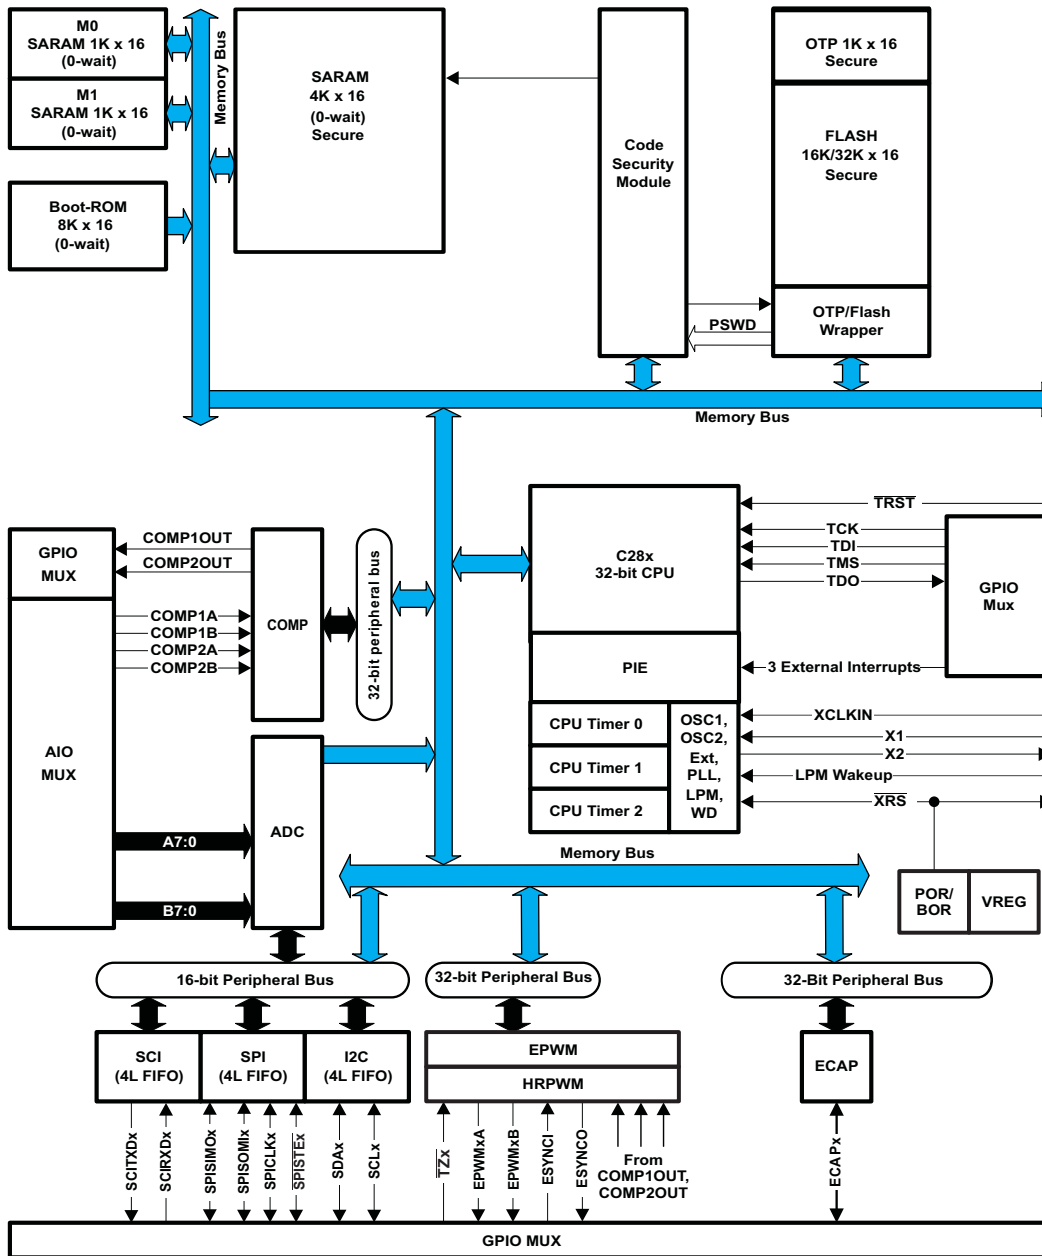

Figure 3-1. Functional Block Diagram

ADVANCE INFORMATION

3.2 Memory Maps

In Figure 3-2, the following apply:

- Memory blocks are not to scale.
- Peripheral Frame 0, Peripheral Frame 1 and Peripheral Frame 2 memory maps are restricted to data memory only. A user program cannot access these memory maps in program space.
- *Protected* means the order of Write-followed-by-Read operations is preserved rather than the pipeline order.
- Certain memory ranges are EALLOW protected against spurious writes after configuration.
- Locations 0x3D7C80 – 0x3D7CC0 contain the internal oscillator and ADC calibration routines. These locations are not programmable by the user.

|-----------------------|---|
| 0x3F 4000 - 0x3F 4FFF | Sector D (4K x 16) |
| 0x3F 5000 - 0x3F 5FFF | Sector C (4K x 16) |
| 0x3F 6000 - 0x3F 6FFF | Sector B (4K x 16) |
| 0x3F 7000 - 0x3F 7F7F | Sector A (4K x 16) |
| 0x3F 7F80 - 0x3F 7FF5 | Program to 0x0000 when using the Code Security Module |
| 0x3F 7FF6 - 0x3F 7FF7 | Boot-to-Flash Entry Point (program branch instruction here) |
| 0x3F 7FF8 - 0x3F 7FFF | Security Password (128-Bit) (Do not program to all zeros) |

NOTE

- When the code-security passwords are programmed, all addresses between 0x3F 7F80 and 0x3F 7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
- If the code security feature is not used, addresses 0x3F 7F80 through 0x3F 7FEF may be used for code or data. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data and should not contain program code.

[Table 3-3](#) shows how to handle these memory locations.

Table 3-3. Impact of Using the Code Security Module

| ADDRESS | FLASH | |
|-----------------------|-----------------------|---------------------------|
| | Code security enabled | Code security disabled |
| 0x3F 7F80 - 0x3F 7FEF | Fill with 0x0000 | Application code and data |
| 0x3F 7FF0 - 0x3F 7FF5 | | Reserved for data only |

Peripheral Frame 1 and Peripheral Frame 2 are grouped together to enable these blocks to be write/read peripheral block protected. The protected mode makes sure that all accesses to these blocks happen as written. Because of the pipeline, a write immediately followed by a read to different memory locations, will appear in reverse order on the memory bus of the CPU. This can cause problems in certain peripheral applications where the user expected the write to occur first (as written). The CPU supports a block protection mode where a region of memory can be protected so that operations occur as written (the penalty is extra cycles are added to align the operations). This mode is programmable and by default, it protects the selected zones.

The wait-states for the various spaces in the memory map area are listed in [Table 3-4](#).

Table 3-4. Wait-states

| AREA | WAIT-STATES (CPU) | COMMENTS |
|--------------------|--|---|
| M0 and M1 SARAMs | 0-wait | Fixed |
| Peripheral Frame 0 | 0-wait | |
| Peripheral Frame 1 | 0-wait (writes) 2-wait (reads) | Cycles can be extended by peripheral generated ready. |
| Peripheral Frame 2 | 0-wait (writes) 2-wait (reads) | Fixed. Cycles cannot be extended by the peripheral. |
| L0 SARAM | 0-wait data and program | Assumes no CPU conflicts |
| OTP | Programmable 1-wait minimum | Programmed via the Flash registers. 1-wait is minimum number of wait states allowed. |
| FLASH | Programmable 0-wait Paged min 1-wait Random min Random \geq Paged | Programmed via the Flash registers. |
| FLASH Password | 16-wait fixed | Wait states of password locations are fixed. |
| Boot-ROM | 0-wait | |

3.3 Brief Descriptions

3.3.1 CPU

The 2802x (C28x) family is a member of the TMS320C2000™ microcontroller (MCU) platform. The C28x-based controllers have the same 32-bit fixed-point architecture as existing C28x MCUs. It is a very efficient C/C++ engine, enabling users to develop not only their system control software in a high-level language, but also enabling development of math algorithms using C/C++. The device is as efficient at MCU math tasks as it is at system control tasks that typically are handled by microcontroller devices. This efficiency removes the need for a second processor in many systems. The 32 x 32-bit MAC 64-bit processing capabilities enable the controller to handle higher numerical resolution problems efficiently. Add to this the fast interrupt response with automatic context save of critical registers, resulting in a device that is capable of servicing many asynchronous events with minimal latency. The device has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables it to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special store conditional operations further improve performance.

3.3.2 Memory Bus (Harvard Bus Architecture)

As with many MCU-type devices, multiple busses are used to move data between the memories and peripherals and the CPU. The memory bus architecture contains a program read bus, data read bus, and data write bus. The program read bus consists of 22 address lines and 32 data lines. The data read and write busses consist of 32 address lines and 32 data lines each. The 32-bit-wide data busses enable single cycle 32-bit operations. The multiple bus architecture, commonly termed Harvard Bus, enables the C28x to fetch an instruction, read a data value and write a data value in a single cycle. All peripherals and memories attached to the memory bus prioritize memory accesses. Generally, the priority of memory bus accesses can be summarized as follows:

| | | |
|----------|----------------|--|
| Highest: | Data Writes | (Simultaneous data and program writes cannot occur on the memory bus.) |
| | Program Writes | (Simultaneous data and program writes cannot occur on the memory bus.) |
| | Data Reads | |
| | Program Reads | (Simultaneous program reads and fetches cannot occur on the memory bus.) |
| Lowest: | Fetches | (Simultaneous program reads and fetches cannot occur on the memory bus.) |

3.3.3 Peripheral Bus

To enable migration of peripherals between various Texas Instruments (TI) MCU family of devices, the devices adopt a peripheral bus standard for peripheral interconnect. The peripheral bus bridge multiplexes the various busses that make up the processor Memory Bus into a single bus consisting of 16 address lines and 16 or 32 data lines and associated control signals. Three versions of the peripheral bus are supported. One version supports only 16-bit accesses (called peripheral frame 2). Another version supports both 16- and 32-bit accesses (called peripheral frame 1).

3.3.4 Real-Time JTAG and Analysis

The devices implement the standard IEEE 1149.1 JTAG⁽¹⁾ interface for in-circuit based debug. Additionally, the devices support real-time mode of operation allowing modification of the contents of memory, peripheral, and register locations while the processor is running and executing code and servicing interrupts. The user can also single step through non-time-critical code while enabling time-critical interrupts to be serviced without interference. The device implements the real-time mode in

(1) IEEE Standard 1149.1-1990 Standard Test Access Port and Boundary Scan Architecture

hardware within the CPU. This is a feature unique to the 28x family of devices, requiring no software monitor. Additionally, special analysis hardware is provided that allows setting of hardware breakpoint or data/address watch-points and generating various user-selectable break events when a match occurs. These devices do not support boundary scan; however, IDCODE and BYPASS features are available if the following considerations are taken into account. The IDCODE does not come by default. The user needs to go through a sequence of SHIFT IR and SHIFT DR state of JTAG to get the IDCODE. For BYPASS instruction, the first shifted DR value would be 1.

3.3.5 Flash

The F28027/25/23 devices contain 32K x 16 of embedded flash memory, segregated into four 8K x 16 sectors. The F28026/24/22 devices contain 16K x 16 of embedded flash memory, segregated into four 4K x 16 sectors. All devices also contain a single 1K x 16 of OTP memory at address range 0x3D 7800 – 0x3D 7BFF. The user can individually erase, program, and validate a flash sector while leaving other sectors untouched. However, it is not possible to use one sector of the flash or the OTP to execute flash algorithms that erase/program other sectors. Special memory pipelining is provided to enable the flash module to achieve higher performance. The flash/OTP is mapped to both program and data space; therefore, it can be used to execute code or store data information. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data variables and should not contain program code.

NOTE

The Flash and OTP wait-states can be configured by the application. This allows applications running at slower frequencies to configure the flash to use fewer wait-states.

Flash effective performance can be improved by enabling the flash pipeline mode in the Flash options register. With this mode enabled, effective performance of linear code execution will be much faster than the raw performance indicated by the wait-state configuration alone. The exact performance gain when using the Flash pipeline mode is application-dependent.

For more information on the Flash options, Flash wait-state, and OTP wait-state registers, see the *TMS320x2802x System Control and Interrupts Reference Guide* (literature number [SPRUFN3](#)).

3.3.6 M0, M1 SARAMs

All devices contain these two blocks of single access memory, each 1K x 16 in size. The stack pointer points to the beginning of block M1 on reset. The M0 and M1 blocks, like all other memory blocks on C28x devices, are mapped to both program and data space. Hence, the user can use M0 and M1 to execute code or for data variables. The partitioning is performed within the linker. The C28x device presents a unified memory map to the programmer. This makes for easier programming in high-level languages.

3.3.7 L0 SARAM

The device contains 4K x 16 of single-access memory. This block is mapped to both program and data space.

3.3.8 Boot ROM

The Boot ROM is factory-programmed with boot-loading software. Boot-mode signals are provided to tell the bootloader software what boot mode to use on power up. The user can select to boot normally or to download new software from an external connection or to select boot software that is programmed in the internal Flash/ROM. The Boot ROM also contains standard tables, such as SIN/COS waveforms, for use in math-related algorithms.

Table 3-5. Boot Mode Selection

| MODE | GPIO37/TDO | GPIO34/CMP2OUT | TRST | MODE |
|------|------------|----------------|------|--|
| 3 | 1 | 1 | 0 | GetMode |
| 2 | 1 | 0 | 0 | Wait (see Section 3.3.9 for description) |
| 1 | 0 | 1 | 0 | SCI |
| 0 | 0 | 0 | 0 | Parallel IO |
| EMU | x | x | 1 | Emulation Boot |

3.3.8.1 Emulation Boot

When the emulator is connected, the GPIO37/TDO pin cannot be used for boot mode selection. In this case, the boot ROM detects that an emulator is connected and uses the contents of two reserved SARAM locations in the PIE vector table to determine the boot mode. If the content of either location is invalid, then the *Wait* boot option is used. All boot mode options can be accessed in emulation boot.

3.3.8.2 GetMode

The default behavior of the *GetMode* option is to boot to flash. This behavior can be changed to another boot option by programming two locations in the OTP. One of the following loaders can be specified: SCI, SPI, I2C, or OTP. If the content of either OTP location is invalid, then boot to flash is used.

3.3.9 Security

The devices support high levels of security to protect the user firmware from being reverse engineered. The security features a 128-bit password (hardcoded for 16 wait-states), which the user programs into the flash. One code security module (CSM) is used to protect the flash/OTP and the L0/L1 SARAM blocks. The security feature prevents unauthorized users from examining the memory contents via the JTAG port, executing code from external memory or trying to boot-load some undesirable software that would export the secure memory contents. To enable access to the secure blocks, the user must write the correct 128-bit KEY value that matches the value stored in the password locations within the Flash.

In addition to the CSM, the emulation code security logic (ECSL) has been implemented to prevent unauthorized users from stepping through secure code. Any code or data access to flash, user OTP, or L0 memory while the emulator is connected will trip the ECSL and break the emulation connection. To allow emulation of secure code, while maintaining the CSM protection against secure memory reads, the user must write the correct value into the lower 64 bits of the KEY register, which matches the value stored in the lower 64 bits of the password locations within the flash. Note that dummy reads of all 128 bits of the password in the flash must still be performed. If the lower 64 bits of the password locations are all ones (unprogrammed), then the KEY value does not need to match.

When initially debugging a device with the password locations in flash programmed (i.e., secured), the CPU will start running and may execute an instruction that performs an access to a protected ECSL area. If this happens, the ECSL will trip and cause the emulator connection to be cut.

The solution is to use the *Wait* boot option. This will sit in a loop around a software breakpoint to allow an emulator to be connected without tripping security. The user can then exit this mode once the emulator is connected by using one of the emulation boot options as described in the *TMS320x2802x Boot ROM Reference Guide* ([SPRUFN6](#)). Piccolo devices do not support a hardware wait-in-reset mode.

NOTE

- When the code-security passwords are programmed, all addresses between 0x3F7F80 and 0x3F7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
 - If the code security feature is not used, addresses 0x3F7F80 through 0x3F7FEF may be used for code or data. Addresses 0x3F7FF0 – 0x3F7FF5 are reserved for data and should not contain program code.
- The 128-bit password (at 0x3F 7FF8 – 0x3F 7FFF) must not be programmed to zeros. Doing so would permanently lock the device.
-

EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

3.3.10 Peripheral Interrupt Expansion (PIE) Block

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the F2802x, 33 of the possible 96 interrupts are used by peripherals. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of the 96 interrupts is supported by its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is automatically fetched by the CPU on servicing the interrupt. It takes 8 CPU clock cycles to fetch the vector and save critical CPU registers. Hence the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled/disabled within the PIE block.

3.3.11 External Interrupts (XINT1-XINT3)

The devices support three masked external interrupts (XINT1-XINT3). Each of the interrupts can be selected for negative, positive, or both negative and positive edge triggering and can also be enabled/disabled. These interrupts also contain a 16-bit free running up counter, which is reset to zero when a valid interrupt edge is detected. This counter can be used to accurately time stamp the interrupt. There are no dedicated pins for the external interrupts. XINT1, XINT2, and XINT3 interrupts can accept inputs from GPIO0 – GPIO31 pins.

3.3.12 Internal Zero Pin Oscillators, Oscillator, and PLL

The device can be clocked by either of the two internal zero-pin oscillators, an external oscillator, or by a crystal attached to the on-chip oscillator circuit (48-pin devices only). A PLL is provided supporting up to 12 input-clock-scaling ratios. The PLL ratios can be changed on-the-fly in software, enabling the user to scale back on operating frequency if lower power operation is desired. Refer to the Electrical Specification section for timing details. The PLL block can be set in bypass mode.

3.3.13 Watchdog

Each device contains two watchdogs: CPU-Watchdog that monitors the core and NMI-Watchdog that is a missing clock-detect circuit. The user software must regularly reset the CPU-watchdog counter within a certain time frame; otherwise, the CPU-watchdog generates a reset to the processor. The CPU-watchdog can be disabled if necessary. The NMI-Watchdog engages only in case of a clock failure and can either generate an interrupt or a device reset.

3.3.14 Peripheral Clocking

The clocks to each individual peripheral can be enabled/disabled to reduce power consumption when a peripheral is not in use. Additionally, the system clock to the serial ports (except I2C) can be scaled relative to the CPU clock.

3.3.15 Low-power Modes

The devices are full static CMOS devices. Three low-power modes are provided:

- IDLE:** Place CPU in low-power mode. Peripheral clocks may be turned off selectively and only those peripherals that need to function during IDLE are left operating. An enabled interrupt from an active peripheral or the watchdog timer will wake the processor from IDLE mode.
- STANDBY:** Turns off clock to CPU and peripherals. This mode leaves the oscillator and PLL functional. An external interrupt event will wake the processor and the peripherals. Execution begins on the next valid cycle after detection of the interrupt event
- HALT:** This mode basically shuts down the device and places it in the lowest possible power consumption mode. If the internal zero-pin oscillators are used as the clock source, the HALT mode turns them off, by default. To keep these oscillators from shutting down, the INTOSCnHALTI bits in CLKCTL register may be used. The zero-pin oscillators may thus be used to clock the CPU-watchdog in this mode. If the on-chip crystal oscillator is used as the clock source, it is shut down in this mode. A reset or an external signal (through a GPIO pin) or the CPU-watchdog can wake the device from this mode.

3.3.16 Peripheral Frames 0, 1, 2 (PFn)

The device segregates peripherals into three sections. The mapping of peripherals is as follows:

- PF0:**
 - PIE:** PIE Interrupt Enable and Control Registers Plus PIE Vector Table
 - Flash:** Flash Waitstate Registers
 - Timers:** CPU-Timers 0, 1, 2 Registers
 - CSM:** Code Security Module KEY Registers
 - ADC:** ADC Result Registers
- PF1:**
 - GPIO:** GPIO MUX Configuration and Control Registers
 - ePWM:** Enhanced Pulse Width Modulator Module and Registers
 - eCAP:** Enhanced Capture Module and Registers
 - Comparators:** Comparator Modules

| | | |
|------|------|---|
| PF2: | SYS: | System Control Registers |
| | SCI: | Serial Communications Interface (SCI) Control and RX/TX Registers |
| | SPI: | Serial Port Interface (SPI) Control and RX/TX Registers |
| | ADC: | ADC Status, Control, and Configuration Registers |
| | I2C: | Inter-Integrated Circuit Module and Registers |
| | XINT | External Interrupt Registers |

3.3.17 General-Purpose Input/Output (GPIO) Multiplexer

Most of the peripheral signals are multiplexed with general-purpose input/output (GPIO) signals. This enables the user to use a pin as GPIO if the peripheral signal or function is not used. On reset, GPIO pins are configured as inputs. The user can individually program each pin for GPIO mode or peripheral signal mode. For specific inputs, the user can also select the number of input qualification cycles. This is to filter unwanted noise glitches. The GPIO signals can also be used to bring the device out of specific low-power modes.

3.3.18 32-Bit CPU-Timers (0, 1, 2)

CPU-Timers 0, 1, and 2 are identical 32-bit timers with presetable periods and with 16-bit clock prescaling. The timers have a 32-bit count down register, which generates an interrupt when the counter reaches zero. The counter is decremented at the CPU clock speed divided by the prescale value setting. When the counter reaches zero, it is automatically reloaded with a 32-bit period value. CPU-Timer 2 is connected to INT14 of the CPU. It can be clocked by any one of the following:

- SYCLKOUT (default)
- Internal zero-pin oscillator 1 (INTOSC1)
- Internal zero-pin oscillator 2 (INTSOC2)
- External clock source

CPU-Timer 1 is for general use and can be connected to INT13 of the CPU. CPU-Timer 0 is also for general use and is connected to the PIE block.

3.3.19 Control Peripherals

The devices support the following peripherals that are used for embedded control and communication:

| | |
|-------------|--|
| ePWM: | The enhanced PWM peripheral supports independent/complementary PWM generation, adjustable dead-band generation for leading/trailing edges, latched/cycle-by-cycle trip mechanism. Some of the PWM pins support the HRPWM high resolution duty and period features. The type 1 module found on 2802x devices also supports increased dead-band resolution, enhanced SOC and interrupt generation, and advanced triggering including trip functions based on comparator outputs. |
| eCAP: | The enhanced capture peripheral uses a 32-bit time base and registers up to four programmable events in continuous/one-shot capture modes. This peripheral can also be configured to generate an auxiliary PWM signal. |
| ADC: | The ADC block is a 12-bit converter. It has up to 13 single-ended channels pinned out, depending on the device. It contains two sample-and-hold units for simultaneous sampling. |
| Comparator: | Each comparator block consists of one analog comparator along with an internal 10-bit reference for supplying one input of the comparator. |

3.3.20 Serial Port Peripherals

The devices support the following serial communication peripherals:

- SPI: The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multi-device communications are supported by the master/slave operation of the SPI. The SPI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- SCI: The serial communications interface is a two-wire asynchronous serial port, commonly known as UART. The SCI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- I2C: The inter-integrated circuit (I2C) module provides an interface between a MCU and other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus) specification version 2.1 and connected by way of an I2C-bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the MCU through the I2C module. The I2C contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.

3.4 Register Map

The devices contain four peripheral register spaces. The spaces are categorized as follows:

- Peripheral Frame 0: These are peripherals that are mapped directly to the CPU memory bus. See [Table 3-6](#).
- Peripheral Frame 1: These are peripherals that are mapped to the 32-bit peripheral bus. See [Table 3-7](#).
- Peripheral Frame 2: These are peripherals that are mapped to the 16-bit peripheral bus. See [Table 3-8](#).

Table 3-6. Peripheral Frame 0 Registers⁽¹⁾

| NAME | ADDRESS RANGE | SIZE (×16) | EALLOW PROTECTED ⁽²⁾ |
|-----------------------------------|-----------------------|------------|---------------------------------|
| Device Emulation Registers | 0x00 0880 - 0x00 09FF | 384 | Yes |
| FLASH Registers ⁽³⁾ | 0x00 0A80 - 0x00 0ADF | 96 | Yes |
| Code Security Module Registers | 0x00 0AE0 - 0x00 0AEF | 16 | Yes |
| ADC registers 0 wait read only | 0x00 0B00 - 0x00 0B0F | 16 | No |
| CPU–TIMER0/1/2 Registers | 0x00 0C00 - 0x00 0C3F | 64 | No |
| PIE Registers | 0x00 0CE0 - 0x00 0CFF | 32 | No |
| PIE Vector Table | 0x00 0D00 - 0x00 0DFF | 256 | No |

- (1) Registers in Frame 0 support 16-bit and 32-bit accesses.
- (2) If registers are EALLOW protected, then writes cannot be performed until the EALLOW instruction is executed. The EDIS instruction disables writes to prevent stray code or pointers from corrupting register contents.
- (3) The Flash Registers are also protected by the Code Security Module (CSM).

Table 3-7. Peripheral Frame 1 Registers

| NAME | ADDRESS RANGE | SIZE (x16) | EALLOW PROTECTED |
|--------------------------|-----------------------|------------|------------------|
| Comparator 1 registers | 0x00 6400 - 0x00 641F | 32 | (1) |
| Comparator 2 registers | 0x00 6420 - 0x00 643F | 32 | (1) |
| EPWM1 + HRPWM1 registers | 0x00 6800 - 0x00 683F | 64 | (1) |
| EPWM2 + HRPWM2 registers | 0x00 6840 - 0x00 687F | 64 | (1) |
| EPWM3 + HRPWM3 registers | 0x00 6880 - 0x00 68BF | 64 | (1) |
| EPWM4 + HRPWM4 registers | 0x00 68C0 - 0x00 68FF | 64 | (1) |
| ECAP1 registers | 0x00 6A00 - 0x00 6A1F | 32 | No |
| GPIO registers | 0x00 6F80 - 0x00 6FFF | 128 | (1) |

(1) Some registers are EALLOW protected. See the module reference guide for more information.

Table 3-8. Peripheral Frame 2 Registers

| NAME | ADDRESS RANGE | SIZE (x16) | EALLOW PROTECTED |
|----------------------------------|-----------------------|------------|------------------|
| System Control Registers | 0x00 7010 - 0x00 702F | 32 | Yes |
| SPI-A Registers | 0x00 7040 - 0x00 704F | 16 | No |
| SCI-A Registers | 0x00 7050 - 0x00 705F | 16 | No |
| NMI Watchdog Interrupt Registers | 0x00 7060 - 0x00 706F | 16 | Yes |
| External Interrupt Registers | 0x00 7070 - 0x00 707F | 16 | Yes |
| ADC Registers | 0x00 7100 - 0x00 717F | 32 | (1) |
| I2C-A Registers | 0x00 7900 - 0x00 793F | 64 | (1) |

(1) Some registers are EALLOW protected. See the module reference guide for more information.

3.5 Device Emulation Registers

These registers are used to control the protection mode of the C28x CPU and to monitor some critical device signals. The registers are defined in [Table 3-9](#).

Table 3-9. Device Emulation Registers

| NAME | ADDRESS RANGE | SIZE (x16) | DESCRIPTION | EALLOW PROTECTED |
|-----------|------------------|------------|---|------------------|
| DEVICECNF | 0x0880 0x0881 | 2 | Device Configuration Register | Yes |
| CLASSID | 0x0882 | 1 | Class ID Register TMS320F28027 0x00CF TMS320F28026 0x00C7 TMS320F28025 0x00CF TMS320F28024 0x00C7 TMS320F28023 0x00CF TMS320F28022 0x00C7 | No |
| REVID | 0x0883 | 1 | Revision ID Register 0x0000 - Silicon Rev. 0 - TMX | No |

3.6 Interrupts

Figure 3-4 shows how the various interrupt sources are multiplexed.

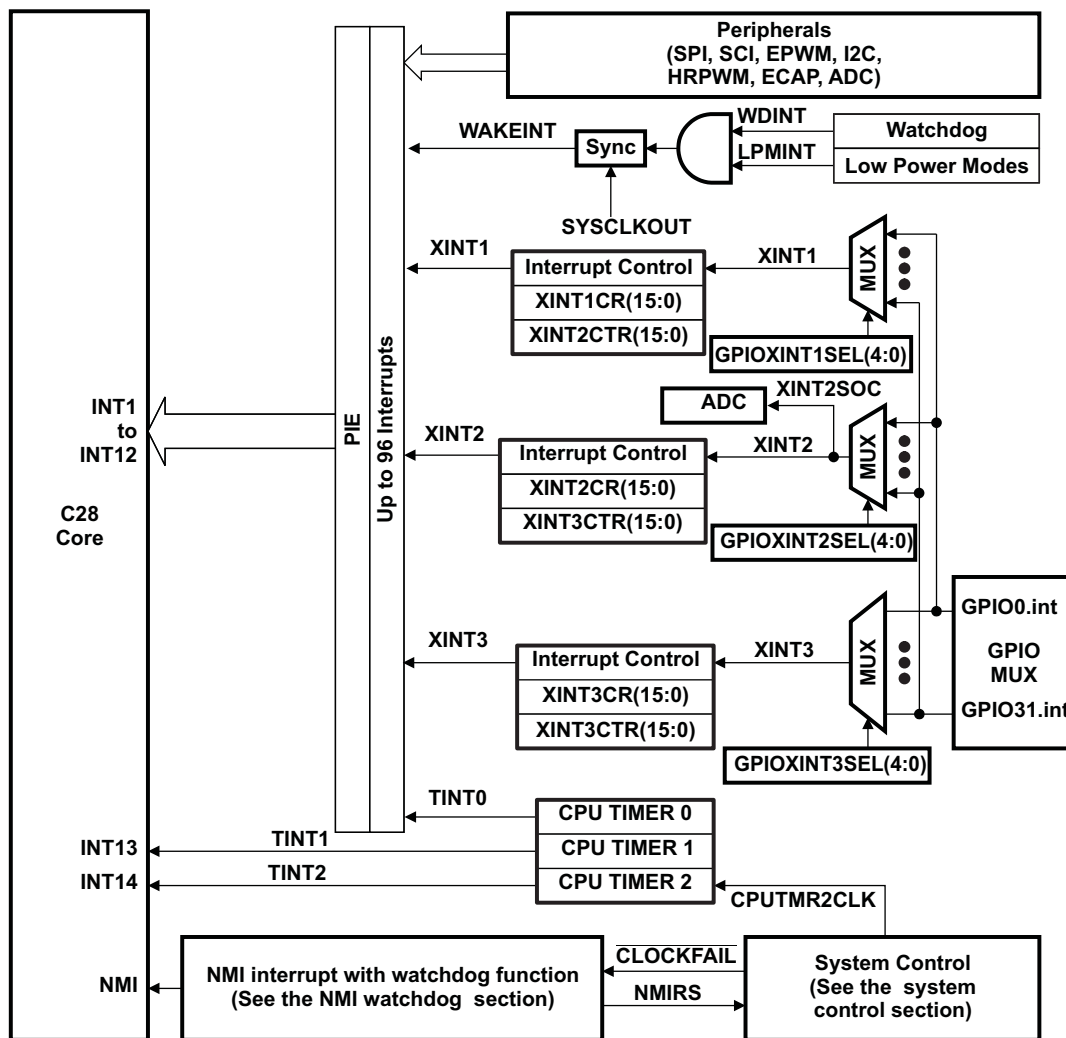

Figure 3-4. External and PIE Interrupt Sources

Eight PIE block interrupts are grouped into one CPU interrupt. In total, 12 CPU interrupt groups, with 8 interrupts per group equals 96 possible interrupts. Table 3-10 shows the interrupts used by 2802x devices.

The TRAP #VectorNumber instruction transfers program control to the interrupt service routine corresponding to the vector specified. TRAP #0 attempts to transfer program control to the address pointed to by the reset vector. The PIE vector table does not, however, include a reset vector. Therefore, TRAP #0 should not be used when the PIE is enabled. Doing so will result in undefined behavior.

When the PIE is enabled, TRAP #1 through TRAP #12 will transfer program control to the interrupt service routine corresponding to the first vector within the PIE group. For example: TRAP #1 fetches the vector from INT1.1, TRAP #2 fetches the vector from INT2.1, and so forth.

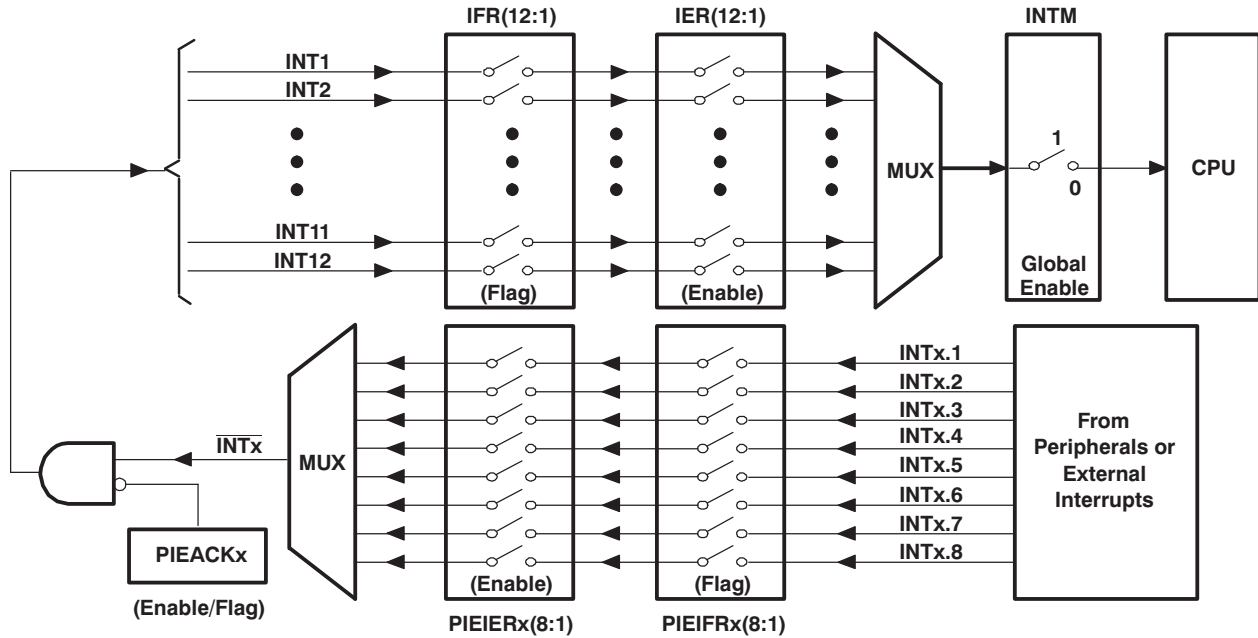

Figure 3-5. Multiplexing of Interrupts Using the PIE Block

Table 3-10. PIE MUXed Peripheral Interrupt Vector Table

| | INTx.8 | INTx.7 | INTx.6 | INTx.5 | INTx.4 | INTx.3 | INTx.2 | INTx.1 |

3.6.1 External Interrupts

Table 3-12. External Interrupt Registers

| NAME | ADDRESS | SIZE (x16) | DESCRIPTION |
|----------|-----------|------------|------------------------------|
| XINT1CR | 0x00 7070 | 1 | XINT1 configuration register |
| XINT2CR | 0x00 7071 | 1 | XINT2 configuration register |
| XINT3CR | 0x00 7072 | 1 | XINT3 configuration register |
| XINT1CTR | 0x00 7078 | 1 | XINT1 counter register |
| XINT2CTR | 0x00 7079 | 1 | XINT2 counter register |
| XINT3CTR | 0x00 707A | 1 | XINT3 counter register |

Each external interrupt can be enabled/disabled or qualified using positive, negative, or both positive and negative edge. For more information, see the *TMS320x2802x System and Interrupts Reference Guide* (literature number [SPRUFN3](#)).

3.7 VREG/BOR/POR

Although the core and I/O circuitry operate on two different voltages, these devices have an on-chip voltage regulator (VREG) to generate the V_{DD} voltage from the V_{DDIO} supply. This eliminates the cost and space of a second external regulator on an application board. Additionally, internal power-on reset (POR) and brown-out reset (BOR) circuits monitor both the V_{DD} and V_{DDIO} rails during power-up and run mode, eliminating a need for any external voltage supervisory circuits.

3.7.1 On-chip Voltage Regulator (VREG)

A linear regulator generates the core voltage (V_{DD}) from the V_{DDIO} supply. Therefore, although capacitors are required on each V_{DD} pin to stabilize the generated voltage, power need not be supplied to these pins to operate the device. Conversely, the VREG can be disabled, should power or redundancy be the primary concern of the application.

3.7.1.1 Using the On-chip VREG

To utilize the on-chip VREG, the $\overline{\text{VREGENZ}}$ pin should be pulled low and the appropriate recommended operating voltage should be supplied to the V_{DDIO} and V_{DDA} pins. In this case, the V_{DD} voltage needed by the core logic will be generated by the VREG. Each V_{DD} pin requires on the order of 1.2 μF capacitance for proper regulation of the VREG. These capacitors should be located as close as possible to the V_{DD} pins.

3.7.1.2 Disabling the On-chip VREG

To conserve power, it is also possible to disable the on-chip VREG and supply the core logic voltage to the V_{DD} pins with a more efficient external regulator. To enable this option, the $\overline{\text{VREGENZ}}$ pin must be pulled high.

3.7.2 On-chip Power-On Reset (POR) and Brown-Out Reset (BOR) Circuit

Two on-chip supervisory circuits, the power-on reset (POR) and the brown-out reset (BOR) remove the burden of monitoring the V_{DD} and V_{DDIO} supply rails from the application board. The purpose of the POR is to create a clean reset throughout the device during the entire power-up procedure. The trip point is a looser, lower trip point than the BOR, which watches for dips in the V_{DD} or V_{DDIO} rail during device operation. The POR function is present on both V_{DD} and V_{DDIO} rails at all times. After initial device power-up, the BOR function is present on V_{DDIO} at all times, and on V_{DD} when the internal VREG is enabled ($\overline{\text{VREGENZ}}$ pin is pulled low). Both functions pull the $\overline{\text{XRS}}$ pin low when one of the voltages is below their respective trip point. See the [Section 6](#) for the various trip points as well as the delay time from the voltage rising past the trip point and the release of the $\overline{\text{XRS}}$ pin. [Figure 3-6](#) shows the VREG, POR, and BOR.

- A. \overline{WDRST} is the reset signal from the CPU-watchdog.
- B. \overline{PBRs} is the reset signal from the POR/BOR module.

Figure 3-6. VREG + POR + BOR + Reset Signal Connectivity

ADVANCE INFORMATION

3.8 System Control

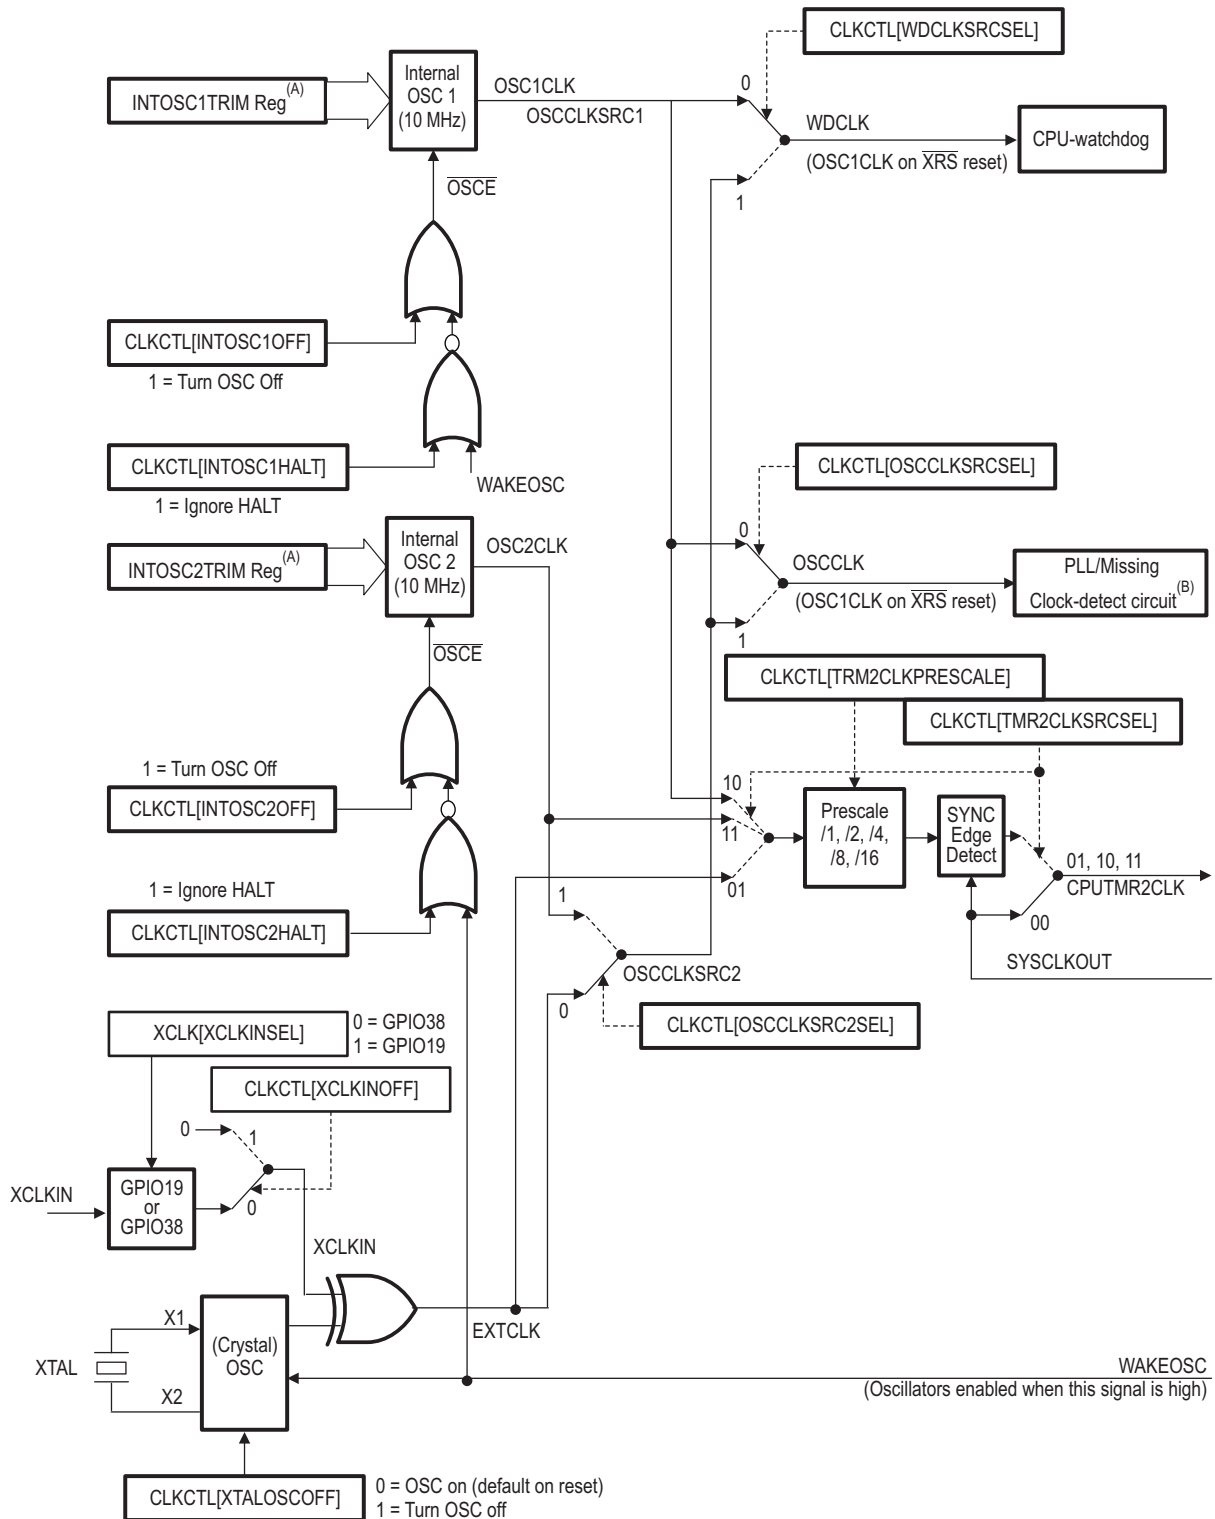

This section describes the oscillator and clocking mechanisms, the watchdog function and the low power modes. Figure 3-7 shows the various clock domains that are discussed. Figure 3-8 shows the various clock sources (both internal and external) that can provide a clock for device operation.

- A. CLKIN is the clock into the CPU. It is passed out of the CPU as SYSCLKOUT (that is, CLKIN is the same frequency as SYSCLKOUT).

Figure 3-7. Clock and Reset Domains

ADVANCE INFORMATION

- A. Register loaded from TI OTP-based calibration function.
- B. See Section 3.8.4 for details on missing clock detection.

Figure 3-8. Clock Tree

ADVANCE INFORMATION

3.8.1 Internal Zero Pin Oscillators

The F2802x devices contain two independent internal zero pin oscillators. By default both oscillators are turned on at power up, and internal oscillator 1 is the default clock source at this time. For power savings, unused oscillators may be powered down by the user. The center frequency of these oscillators is determined by their respective oscillator trim registers, written to in the calibration routine as part of the boot ROM execution. See the electrical section for more information on these oscillators.

3.8.2 External Reference Oscillator Clock Option

The typical specifications for the external quartz crystal for a frequency of 10 MHz are listed below:

- Fundamental mode, parallel resonant
- C_L (load capacitance) = 12 pF
- $C_{L1} = C_{L2} = 24$ pF
- $C_{shunt} = 6$ pF
- ESR range = 30 to 60 Ω

TI recommends that customers have the resonator/crystal vendor characterize the operation of their device with the MCU chip. The resonator/crystal vendor has the equipment and expertise to tune the tank circuit. The vendor can also advise the customer regarding the proper tank component values that will produce proper start up and stability over the entire operating range.

Table 3-13. PLL, Clocking, Watchdog, and Low-Power Mode Registers

| NAME | ADDRESS | SIZE (x16) | DESCRIPTION ⁽¹⁾ |
|-------------|-----------|------------|---|

Figure 3-9. Using a 3.3-V External Oscillator

A. X1/X2 pins are available in 48-pin package only.

Figure 3-10. Using the On-chip Crystal Oscillator

3.8.3 PLL-Based Clock Module

The devices have an on-chip, PLL-based clock module. This module provides all the necessary clocking signals for the device, as well as control for low-power mode entry. The PLL has a 4-bit ratio control PLLCR[DIV] to select different CPU clock rates. The watchdog module should be disabled before writing to the PLLCR register. It can be re-enabled (if need be) after the PLL module has stabilized, which takes 1 ms. The input clock and PLLCR[DIV] bits should be chosen in such a way that the output frequency of the PLL (VCOCLK) is at least 50 MHz.

Table 3-14. PLL Settings

| PLLCR[DIV] VALUE ^{(1) (2)} | SYSCLKOUT (CLKIN) | | |
|-------------------------------------|--|--------------------|--------------------|
| | PLLSTS[DIVSEL] = 0 or 1 ⁽³⁾ | PLLSTS[DIVSEL] = 2 | PLLSTS[DIVSEL] = 3 |
| 0000 (PLL bypass) | OSCCLK/4 (Default) ⁽¹⁾ | OSCCLK/2 | OSCCLK |
| 0001 | (OSCCLK * 1)/4 | (OSCCLK * 1)/2 | – |
| 0010 | (OSCCLK * 2)/4 | (OSCCLK * 2)/2 | – |
| 0011 | (OSCCLK * 3)/4 | (OSCCLK * 3)/2 | – |
| 0100 | (OSCCLK * 4)/4 | (OSCCLK * 4)/2 | – |
| 0101 | (OSCCLK * 5)/4 | (OSCCLK * 5)/2 | – |
| 0110 | (OSCCLK * 6)/4 | (OSCCLK * 6)/2 | – |
| 0111 | (OSCCLK * 7)/4 | (OSCCLK * 7)/2 | – |
| 1000 | (OSCCLK * 8)/4 | (OSCCLK * 8)/2 | – |
| 1001 | (OSCCLK * 9)/4 | (OSCCLK * 9)/2 | – |
| 1010 | (OSCCLK * 10)/4 | (OSCCLK * 10)/2 | – |
| 1011 | (OSCCLK * 11)/4 | (OSCCLK * 11)/2 | – |
| 1100 | (OSCCLK * 12)/4 | (OSCCLK * 12)/2 | – |

- (1) The PLL control register (PLLCR) and PLL Status Register (PLLSTS) are reset to their default state by the $\overline{\text{XRS}}$ signal or a watchdog reset only. A reset issued by the debugger or the missing clock detect logic has no effect.
- (2) This register is EALLOW protected. See the *TMS320x2802x System and Interrupts Reference Guide* (literature number [SPRUEN3](#)) for more information.
- (3) By default, PLLSTS[DIVSEL] is configured for /4. (The boot ROM changes this to /1.) PLLSTS[DIVSEL] must be 0 before writing to the PLLCR and should be changed only after PLLSTS[PLLLOCKS] = 1.

Table 3-15. CLKIN Divide Options

| PLLSTS [DIVSEL] | CLKIN DIVIDE |
|-----------------|-------------------|
| 0 | /4 |
| 1 | /4 |
| 2 | /2 |
| 3 | /1 ⁽¹⁾ |

(1) This mode can be used only when the PLL is bypassed or off.

The PLL-based clock module provides four modes of operation:

- **INTOSC1 (Internal zero-pin Oscillator 1):** This is the on-chip internal oscillator 1. This can provide the clock for the Watchdog block, core and CPU-Timer 2
- **INTOSC2 (Internal zero-pin Oscillator 2):** This is the on-chip internal oscillator 2. This can provide the clock for the Watchdog block, core and CPU-Timer 2. Both INTOSC1 and INTOSC2 can be independently chosen for the Watchdog block, core and CPU-Timer 2.
- **Crystal/Resonator Operation:** The on-chip (crystal) oscillator enables the use of an external crystal/resonator attached to the device to provide the time base. The crystal/resonator is connected to the X1/X2 pins. Some devices may not have the X1/X2 pins. See [Table 2-2](#) for details.
- **External clock source operation:** If the on-chip (crystal) oscillator is not used, this mode allows it to be bypassed. The device clocks are generated from an external clock source input on the XCLKIN pin. Note that the XCLKIN is multiplexed with GPIO19 or GPIO38 pin. The XCLKIN input can be selected as GPIO19 or GPIO38 via the XCLKINSEL bit in XCLK register. The CLKCTL[XCLKINOFF] bit disables this clock input (forced low). If the clock source is not used or the respective pins are used as GPIOs, the user should disable at boot time.

Before changing clock sources, ensure that the target clock is present. If a clock is not present, then that clock source must be disabled (using the CLKCTL register) before switching clocks.

Table 3-16. Possible PLL Configuration Modes

| PLL MODE | REMARKS | PLLSTS[DIVSEL] | CLKIN AND SYSCLKOUT |
|------------|---|----------------|----------------------------------|
| PLL Off | Invoked by the user setting the PLOFF bit in the PLLSTS register. The PLL block is disabled in this mode. This can be useful to reduce system noise and for low power operation. The PLLCR register must first be set to 0x0000 (PLL Bypass) before entering this mode. The CPU clock (CLKIN) is derived directly from the input clock on either X1/X2, X1 or XCLKIN. | 0, 1 2 3 | OSCCLK/4 OSCCLK/2 OSCCLK/1 |
| PLL Bypass | PLL Bypass is the default PLL configuration upon power-up or after an external reset (XRS). This mode is selected when the PLLCR register is set to 0x0000 or while the PLL locks to a new frequency after the PLLCR register has been modified. In this mode, the PLL itself is bypassed but the PLL is not turned off. | 0, 1 2 3 | OSCCLK/4 OSCCLK/2 OSCCLK/1 |
| PLL Enable | Achieved by writing a non-zero value n into the PLLCR register. Upon writing to the PLLCR the device will switch to PLL Bypass mode until the PLL locks. | 0, 1 2 | OSCCLK*n/4 OSCCLK*n/2 |

3.8.4 Loss of Input Clock (NMI watchdog function)

The 2802x devices may be clocked from either one of the internal zero-pin oscillators (INTOSC1/INTOSC2), the on-chip crystal oscillator, or from an external clock input. Regardless of the clock source, in PLL-enabled and PLL-bypass mode, if the input clock to the PLL vanishes, the PLL will issue a limp-mode clock at its output. This limp-mode clock continues to clock the CPU and peripherals at a typical frequency of 1-5 MHz.

When the limp mode is activated, a $\overline{\text{CLOCKFAIL}}$ signal is generated that is latched as an NMI interrupt. Depending on how the NMIRESETSEL bit has been configured, a reset to the device can be fired immediately or the NMI watchdog counter can issue a reset when it overflows. In addition to this, the Missing Clock Status (MCLKSTS) bit is set. The NMI interrupt could be used by the application to detect the input clock failure and initiate necessary corrective action such as switching over to an alternative clock source (if available) or initiate a shut-down procedure for the system.

If the software does not respond to the clock-fail condition, the NMI watchdog triggers a reset after a preprogrammed time interval. [Figure 3-11](#) shows the interrupt mechanisms involved.

Figure 3-11. NMI-watchdog

3.8.5 CPU-Watchdog Module

The CPU-watchdog module on the 2802x device is similar to the one used on the 281x/280x/283xx devices. This module generates an output pulse, 512 oscillator clocks wide (OSCCLK), whenever the 8-bit watchdog up counter has reached its maximum value. To prevent this, the user must disable the counter or the software must periodically write a 0x55 + 0xAA sequence into the watchdog key register that resets the watchdog counter. Figure 3-12 shows the various functional blocks within the watchdog module.

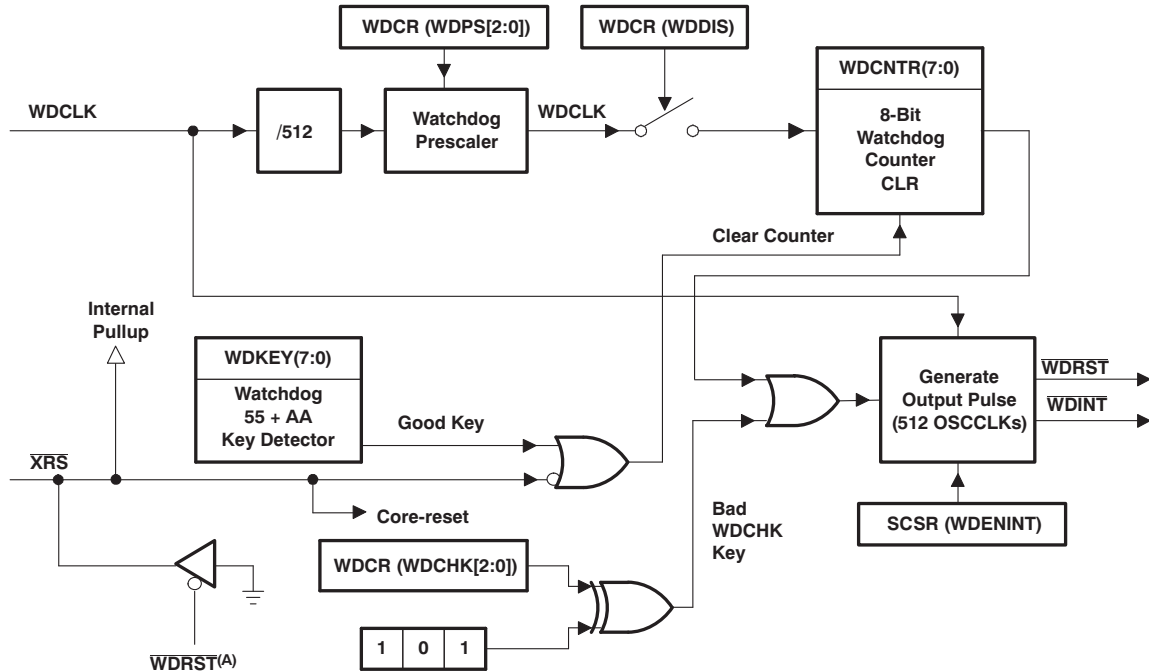

Normally, when the input clocks are present, the CPU-watchdog counter decrements to initiate a CPU-watchdog reset or WDINT interrupt. However, when the external input clock fails, the CPU-watchdog counter stops decrementing (i.e., the watchdog counter does not change with the limp-mode clock).

NOTE

The CPU-watchdog counter is different from the NMI watchdog. It is the legacy watchdog counter that is present in all 28x devices.

NOTE

Applications in which the correct CPU operating frequency is absolutely critical should implement a mechanism by which the MCU will be held in reset, should the input clocks ever fail. For example, an R-C circuit may be used to trigger the \overline{XRS} pin of the MCU, should the capacitor ever get fully charged. An I/O pin may be used to discharge the capacitor on a periodic basis to prevent it from getting fully charged. Such a circuit would also help in detecting failure of the flash memory.

A. The $\overline{\text{WDRST}}$ signal is driven low for 512 OSCCLK cycles.

Figure 3-12. CPU-watchdog Module

The $\overline{\text{WDINT}}$ signal enables the watchdog to be used as a wakeup from IDLE/STANDBY mode.

In STANDBY mode, all peripherals are turned off on the device. The only peripheral that remains functional is the CPU-watchdog. This module will run off OSCCLK. The $\overline{\text{WDINT}}$ signal is fed to the LPM block so that it can wake the device from STANDBY (if enabled). See Section 3.9, Low-Power Modes Block, for more details.

In IDLE mode, the $\overline{\text{WDINT}}$ signal can generate an interrupt to the CPU, via the PIE, to take the CPU out of IDLE mode.

In HALT mode, the CPU-watchdog can be used to wake up the device through a device reset.

3.9 Low-power Modes Block

Table 3-17 summarizes the various modes.

Table 3-17. Low-power Modes

| MODE | LPMCR0(1:0) | OSCCLK | CLKIN | SYSCCLKOUT | EXIT ⁽¹⁾ |
|---------------------|-------------|--|-------|------------|---|
| IDLE | 00 | On | On | On | $\overline{\text{XRS}}$, CPU-watchdog interrupt, any enabled interrupt |
| STANDBY | 01 | On (CPU-watchdog still running) | Off | Off | $\overline{\text{XRS}}$, CPU-watchdog interrupt, GPIO Port A signal, debugger ⁽²⁾ |
| HALT ⁽³⁾ | 1X | Off (on-chip crystal oscillator and PLL turned off, zero-pin oscillator and CPU-watchdog state dependent on user code.) | Off | Off | $\overline{\text{XRS}}$, GPIO Port A signal, debugger ⁽²⁾ , CPU-watchdog |

(1) The Exit column lists which signals or under what conditions the low power mode is exited. A low signal, on any of the signals, exits the low power condition. This signal must be kept low long enough for an interrupt to be recognized by the device. Otherwise, the low-power mode will not be exited and the device will go back into the indicated low power mode.

(2) The JTAG port can still function even if the CPU clock (CLKIN) is turned off.

(3) The WDCLK must be active for the device to go into HALT mode.

The various low-power modes operate as follows:

- IDLE Mode:** This mode is exited by any enabled interrupt that is recognized by the processor. The LPM block performs no tasks during this mode as long as the LPMCR0(LPM) bits are set to 0,0.
- STANDBY Mode:** Any GPIO port A signal (GPIO[31:0]) can wake the device from STANDBY mode. The user must select which signal(s) will wake the device in the GPIOLPMSEL register. The selected signal(s) are also qualified by the OSCCLK before waking the device. The number of OSCCLKs is specified in the LPMCR0 register.
- HALT Mode:** CPU-watchdog, \overline{XRS} , and any GPIO port A signal (GPIO[31:0]) can wake the device from HALT mode. The user selects the signal in the GPIOLPMSEL register.

NOTE

The low-power modes do not affect the state of the output pins (PWM pins included). They will be in whatever state the code left them in when the IDLE instruction was executed. See the *TMS320x2802x System and Interrupts Reference Guide* (literature number [SPRUFN3](#)) for more details.

4 Peripherals

4.1 Analog Block

A 12-bit ADC core is implemented that has different timings than the 12-bit ADC used on F280x/F2833x. The ADC wrapper is modified to incorporate the new timings and also other enhancements to improve the timing control of start of conversions.

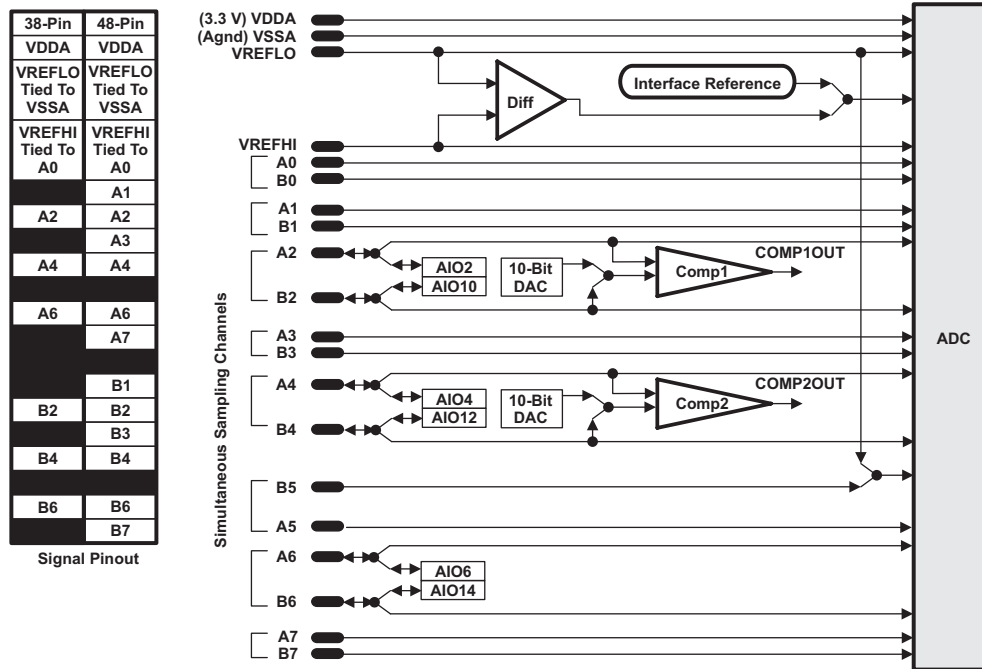

Figure 4-1. Analog Pin Configurations

Figure 4-2 shows the interaction of the analog module with the rest of the F2802x system.

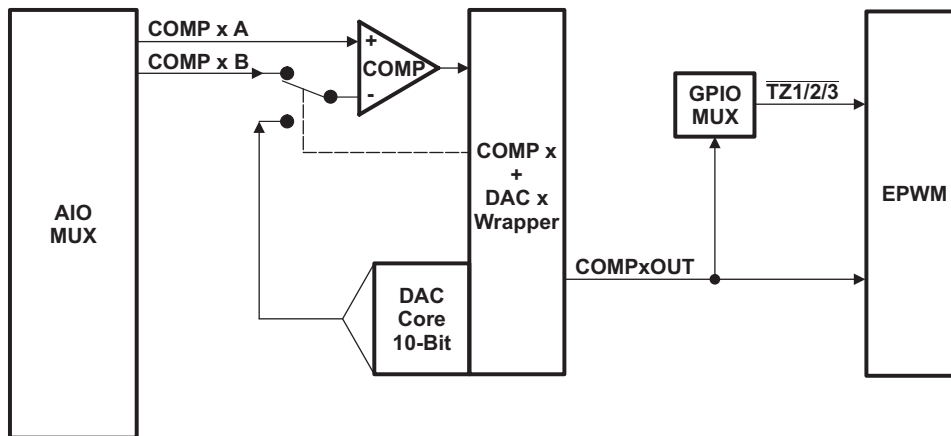

Figure 4-4. Comparator Block Diagram

Table 4-3. Comparator Control Registers

| REGISTER NAME | COMP1 ADDRESS | COMP2 ADDRESS | SIZE (x16) | EALLOW PROTECTED | DESCRIPTION |
|---------------|---------------|---------------|------------|------------------|-----------------------------|
| COMPCTL | 0x6400 | 0x6420 | 1 | Yes | Comparator Control Register |
| COMPSTS | 0x6402 | 0x6422 | 1 | No | Comparator Status Register |
| DACVAL | 0x6406 | 0x6426 | 1 | Yes | DAC Value Register |

4.1 Serial Peripheral Interface (SPI) Module

The device includes the four-pin serial peripheral interface (SPI) module. One SPI module (SPI-A) is available. The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI.

The SPI module features include:

- Four external pins:
 - SPISOMI: SPI slave-output/master-input pin
 - SPISIMO: SPI slave-input/master-output pin
 - SPISTE: SPI slave transmit-enable pin
 - SPICLK: SPI serial-clock pin

NOTE: All four pins can be used as GPIO if the SPI module is not used.

- Two operational modes: master and slave
 Baud rate: 125 different programmable rates.

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{SPIBRR} + 1)} \quad \text{when SPIBRR} = 3 \text{ to } 127$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{4} \quad \text{when SPIBRR} = 0, 1, 2$$

- Data word length: one to sixteen data bits
- Four clocking schemes (controlled by clock polarity and clock phase bits) include:
 - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
 - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
- Nine SPI module control registers: Located in control register frame beginning at address 7040h.

NOTE

All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7-0), and the upper byte (15-8) is read as zeros. Writing to the upper byte has no effect.

Enhanced feature:

- 4-level transmit/receive FIFO
- Delayed transmit control
- Bi-directional 3 wire SPI mode support

The SPI port operation is configured and controlled by the registers listed in [Table 4-4](#).

Table 4-4. SPI-A Registers

| NAME | ADDRESS | SIZE (x16) | EALLOW PROTECTED | DESCRIPTION ⁽¹⁾ |
|----------|---------|------------|------------------|---|
| SPICCR | 0x7040 | 1 | No | SPI-A Configuration Control Register |
| SPICTL | 0x7041 | 1 | No | SPI-A Operation Control Register |
| SPISTS | 0x7042 | 1 | No | SPI-A Status Register |
| SPIBRR | 0x7044 | 1 | No | SPI-A Baud Rate Register |
| SPRXEMU | 0x7046 | 1 | No | SPI-A Receive Emulation Buffer Register |
| SPRXBUF | 0x7047 | 1 | No | SPI-A Serial Input Buffer Register |
| SPITXBUF | 0x7048 | 1 | No | SPI-A Serial Output Buffer Register |
| SPIDAT | 0x7049 | 1 | No | SPI-A Serial Data Register |
| SPIFFTX | 0x704A | 1 | No | SPI-A FIFO Transmit Register |
| SPIFFRX | 0x704B | 1 | No | SPI-A FIFO Receive Register |
| SPIFFCT | 0x704C | 1 | No | SPI-A FIFO Control Register |
| SPIPRI | 0x704F | 1 | No | SPI-A Priority Control Register |

(1) Registers in this table are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

4.2 Serial Communications Interface (SCI) Module

The devices include one serial communications interface (SCI) module (SCI-A). The SCI module supports digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format. The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full-duplex mode. To ensure data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to over 65000 different speeds through a 16-bit baud-select register.

Features of each SCI module include:

- Two external pins:
 - SCITXD: SCI transmit-output pin
 - SCIRXD: SCI receive-input pin
 NOTE: Both pins can be used as GPIO if not used for SCI.
- Baud rate programmable to 64K different rates:

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{BRR} + 1) * 8} \quad \text{when BRR} \neq 0$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{16} \quad \text{when BRR} = 0$$

- Data-word format
 - One start bit
 - Data-word length programmable from one to eight bits
 - Optional even/odd/no parity bit
 - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
 - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
 - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)
- NRZ (non-return-to-zero) format

NOTE

All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7-0), and the upper byte (15-8) is read as zeros. Writing to the upper byte has no effect.

Enhanced features:

- Auto baud-detect hardware logic
- 4-level transmit/receive FIFO

The SCI port operation is configured and controlled by the registers listed in [Table 4-5](#).

Table 4-5. SCI-A Registers⁽¹⁾

| NAME | ADDRESS | SIZE (x16) | EALLOW PROTECTED | DESCRIPTION |
|-------------------------|---------|------------|---------------------|--|
| SCICCRA | 0x7050 | 1 | No | SCI-A Communications Control Register |
| SCICTL1A | 0x7051 | 1 | No | SCI-A Control Register 1 |
| SCIHBAUDA | 0x7052 | 1 | No | SCI-A Baud Register, High Bits |
| SCILBAUDA | 0x7053 | 1 | No | SCI-A Baud Register, Low Bits |
| SCICTL2A | 0x7054 | 1 | No | SCI-A Control Register 2 |
| SCIRXSTA | 0x7055 | 1 | No | SCI-A Receive Status Register |
| SCIRXEMUA | 0x7056 | 1 | No | SCI-A Receive Emulation Data Buffer Register |
| SCIRXBUFA | 0x7057 | 1 | No | SCI-A Receive Data Buffer Register |
| SCITXBUFA | 0x7059 | 1 | No | SCI-A Transmit Data Buffer Register |
| SCIFFTXA ⁽²⁾ | 0x705A | 1 | No | SCI-A FIFO Transmit Register |
| SCIFFRXA ⁽²⁾ | 0x705B | 1 | No | SCI-A FIFO Receive Register |
| SCIFFCTA ⁽²⁾ | 0x705C | 1 | No | SCI-A FIFO Control Register |
| SCIPRIA | 0x705F | 1 | No | SCI-A Priority Control Register |

(1) Registers in this table are mapped to Peripheral Frame 2 space. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

(2) These registers are new registers for the FIFO mode.

Figure 4-6 shows the SCI module block diagram.

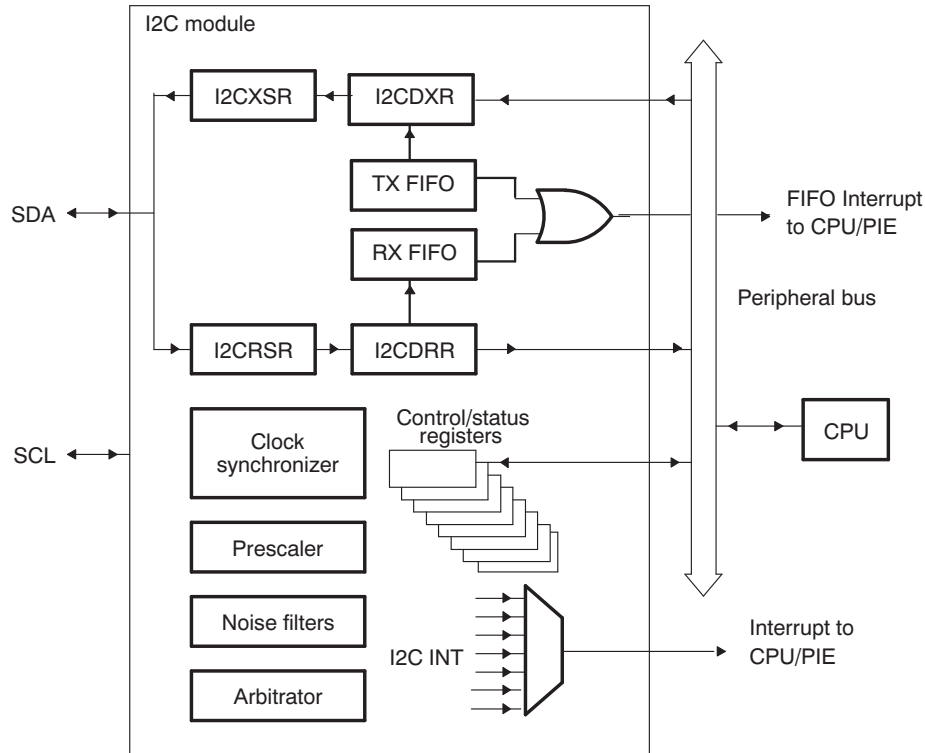

Figure 4-6. Serial Communications Interface (SCI) Module Block Diagram

4.3 Inter-Integrated Circuit (I2C)

The device contains one I2C Serial Port. [Figure 4-7](#) shows how the I2C peripheral module interfaces within the device.

The I2C module has the following features:

- Compliance with the Philips Semiconductors I2C-bus specification (version 2.1):
 - Support for 1-bit to 8-bit format transfers
 - 7-bit and 10-bit addressing modes
 - General call
 - START byte mode
 - Support for multiple master-transmitters and slave-receivers
 - Support for multiple slave-transmitters and master-receivers
 - Combined master transmit/receive and receive/transmit mode
 - Data transfer rate of from 10 kbps up to 400 kbps (I2C Fast-mode rate)
- One 4-word receive FIFO and one 4-word transmit FIFO
- One interrupt that can be used by the CPU. This interrupt can be generated as a result of one of the following conditions:
 - Transmit-data ready
 - Receive-data ready
 - Register-access ready
 - No-acknowledgment received
 - Arbitration lost
 - Stop condition detected
 - Addressed as slave
- An additional interrupt that can be used by the CPU when in FIFO mode
- Module enable/disable capability
- Free data format mode

- A. The I2C registers are accessed at the SYSCLKOUT rate. The internal timing and signal waveforms of the I2C port are also at the SYSCLKOUT rate.
- B. The clock enable bit (I2CAENCLK) in the PCLKCRO register turns off the clock to the I2C port for low power operation. Upon reset, I2CAENCLK is clear, which indicates the peripheral internal clocks are off.

Figure 4-7. I2C Peripheral Module Interfaces

The registers in [Table 4-6](#) configure and control the I2C port operation.

Table 4-6. I2C-A Registers

4.4 Enhanced PWM Modules (ePWM1/2/3/4)

The devices contain up to four enhanced PWM Modules (ePWM). Figure 4-8 shows a block diagram of multiple ePWM modules. Figure 4-8 shows the signal interconnections with the ePWM. See the *TMS320x2802x Enhanced Pulse Width Modulator (ePWM) Module Reference Guide* (literature number [SPRUGE9](#)) for more details.

Table 4-7 shows the complete ePWM register set per module.

A. These events are generated by the Type 1 ePWM digital compare (DC) submodule based on the levels of the COMPxOUT and TZ signals.

Figure 4-9. ePWM Sub-Modules Showing Critical Internal Signal Interconnections

ADVANCE INFORMATION

4.5 High-Resolution PWM (HRPWM)

This module combines multiple delay lines in a single module and a simplified calibration system by using a dedicated calibration delay line. For each ePWM module there is one HR delay line.

The HRPWM module offers PWM resolution (time granularity) that is significantly better than what can be achieved using conventionally derived digital PWM methods. The key points for the HRPWM module are:

- Significantly extends the time resolution capabilities of conventionally derived digital PWM
- This capability can be utilized in both single edge (duty cycle and phase-shift control) as well as dual edge control for frequency/period modulation.
- Finer time granularity control or edge positioning is controlled via extensions to the Compare A and Phase registers of the ePWM module.
- HRPWM capabilities, when available on a particular device, are offered only on the A signal path of an ePWM module (i.e., on the EPWMxA output). EPWMxB output has conventional PWM capabilities.

NOTE

Between 40 to 50 MHz SYSCLKOUT under worst case process, voltage, and temperature (maximum voltage and minimum temperature) conditions, the MEP step delay may decrease to a point such that the maximum of 254 MEP steps may not cover 1 full SYSCLKOUT cycle. In other words, high-resolution edge control will not be available for the full range of a SYSCLKOUT cycle. If running SFO calibration software, the SFO function will return an error code of “2” when this occurs. See the device-specific HRPWM Reference Guide for more information on this error condition.

4.6 Enhanced CAP Modules (eCAP1)

The device contains an enhanced capture (eCAP) module. Figure 4-10 shows a functional block diagram of a module.

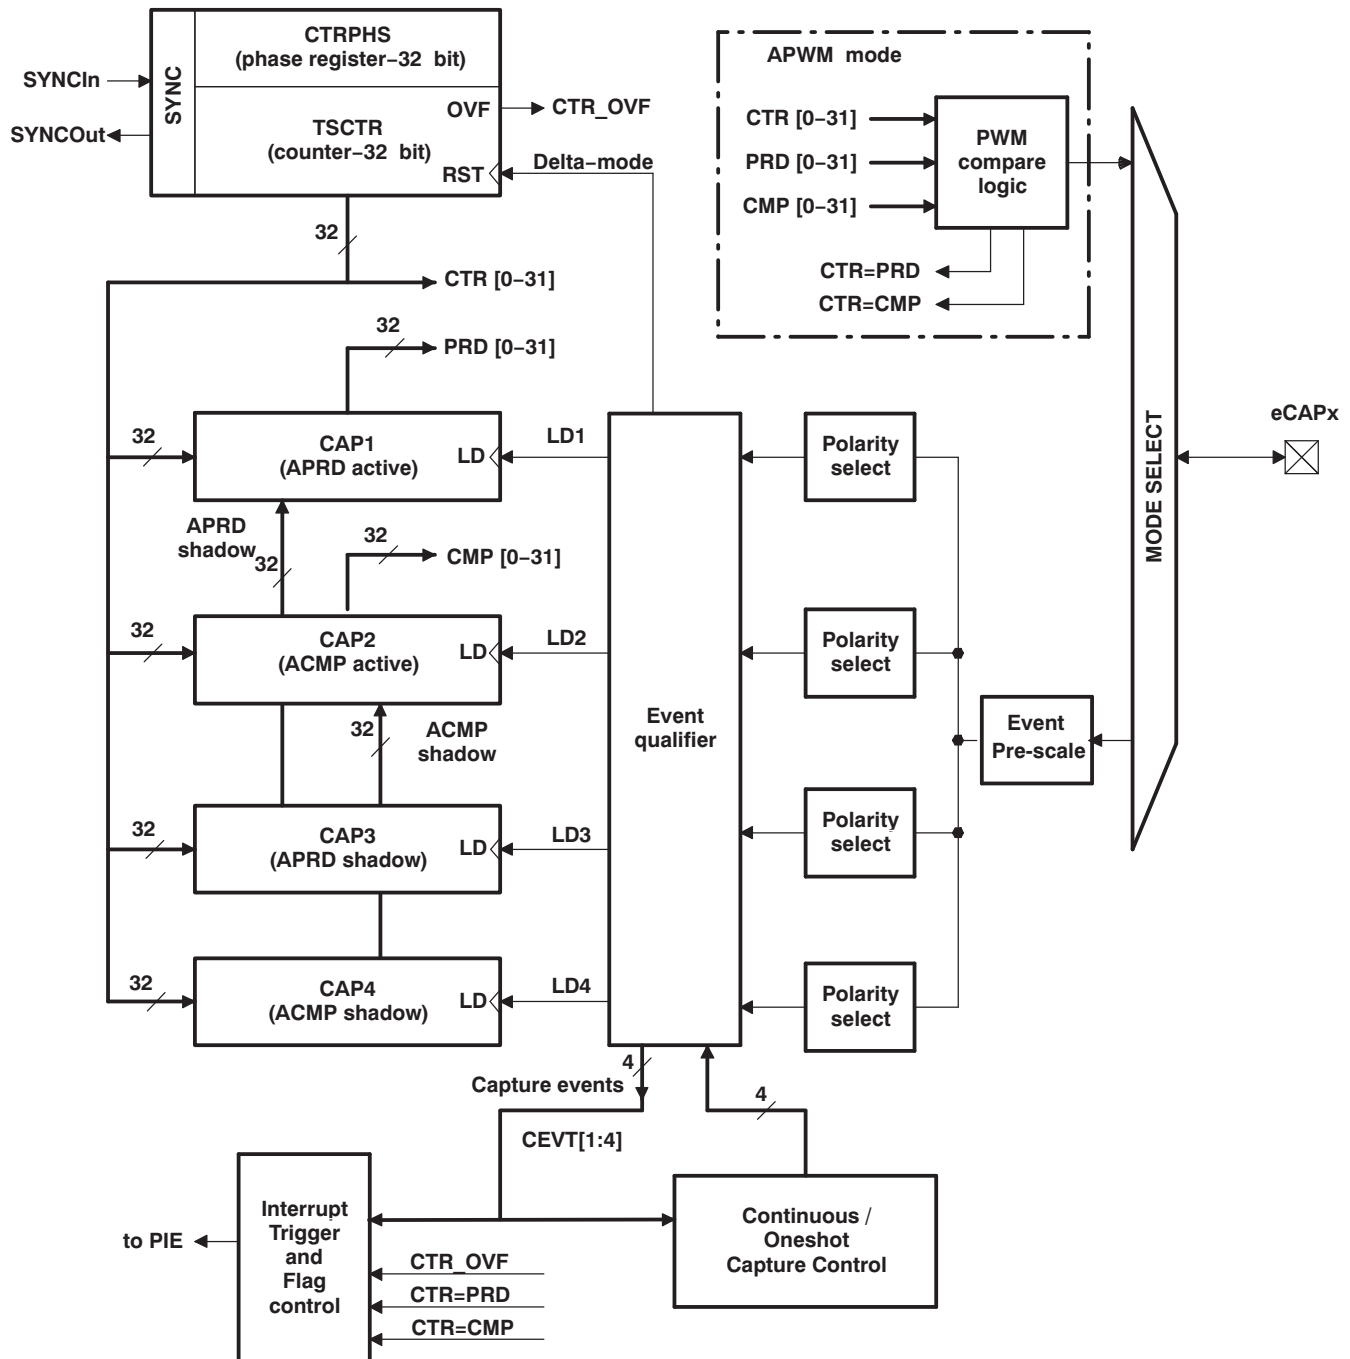

Figure 4-10. eCAP Functional Block Diagram

The eCAP module is clocked at the SYSCLKOUT rate.

The clock enable bits (ECAP1 ENCLK) in the PCLKCR1 register turn off the eCAP module individually (for low power operation). Upon reset, ECAP1ENCLK is set to low, indicating that the peripheral clock is off.

Table 4-8. eCAP Control and Status Registers

4.7 JTAG Port

On the 2802x device, the JTAG port is reduced to 5 pins ($\overline{\text{TRST}}$, TCK, TDI, TMS, TDO). TCK, TDI, TMS and TDO pins are also GPIO pins. The $\overline{\text{TRST}}$ signal selects either JTAG or GPIO operating mode for the pins in [Figure 4-11](#).

NOTE

In 2802x devices, the JTAG pins may also be used as GPIO pins. Care should be taken in the board design to ensure that the circuitry connected to these pins do not affect the emulation capabilities of the JTAG pin function. Any circuitry connected to these pins should not prevent the emulator from driving (or being driven by) the JTAG pins for successful debug.

Figure 4-11. JTAG/GPIO Multiplexing

4.8 GPIO MUX

The GPIO MUX can multiplex up to three independent peripheral signals on a single GPIO pin in addition to providing individual pin bit-banging I/O capability.

The device supports 22 GPIO pins. The GPIO control and data registers are mapped to Peripheral Frame 1 to enable 32-bit operations on the registers (along with 16-bit operations). Table 4-9 shows the GPIO register mapping.

Table 4-9. GPIO Registers

The user can select the type of input qualification for each GPIO pin via the GPxQSEL1/2 registers from four choices:

- Synchronization To SYSCLKOUT Only (GPxQSEL1/2=0, 0): This is the default mode of all GPIO pins at reset and it simply synchronizes the input signal to the system clock (SYSCLKOUT).
- Qualification Using Sampling Window (GPxQSEL1/2=0, 1 and 1, 0): In this mode the input signal, after synchronization to the system clock (SYSCLKOUT), is qualified by a specified number of cycles before the input is allowed to change.
- The sampling period is specified by the QUALPRD bits in the GPxCTRL register and is configurable in groups of 8 signals. It specifies a multiple of SYSCLKOUT cycles for sampling the input signal. The sampling window is either 3-samples or 6-samples wide and the output is only changed when ALL samples are the same (all 0s or all 1s) as shown in Figure 4-18 (for 6 sample mode).
- No Synchronization (GPxQSEL1/2=1,1): This mode is used for peripherals where synchronization is not required (synchronization is performed within the peripheral).

Due to the multi-level multiplexing that is required on the device, there may be cases where a peripheral input signal can be mapped to more than one GPIO pin. Also, when an input signal is not selected, the input signal will default to either a 0 or 1 state, depending on the peripheral.

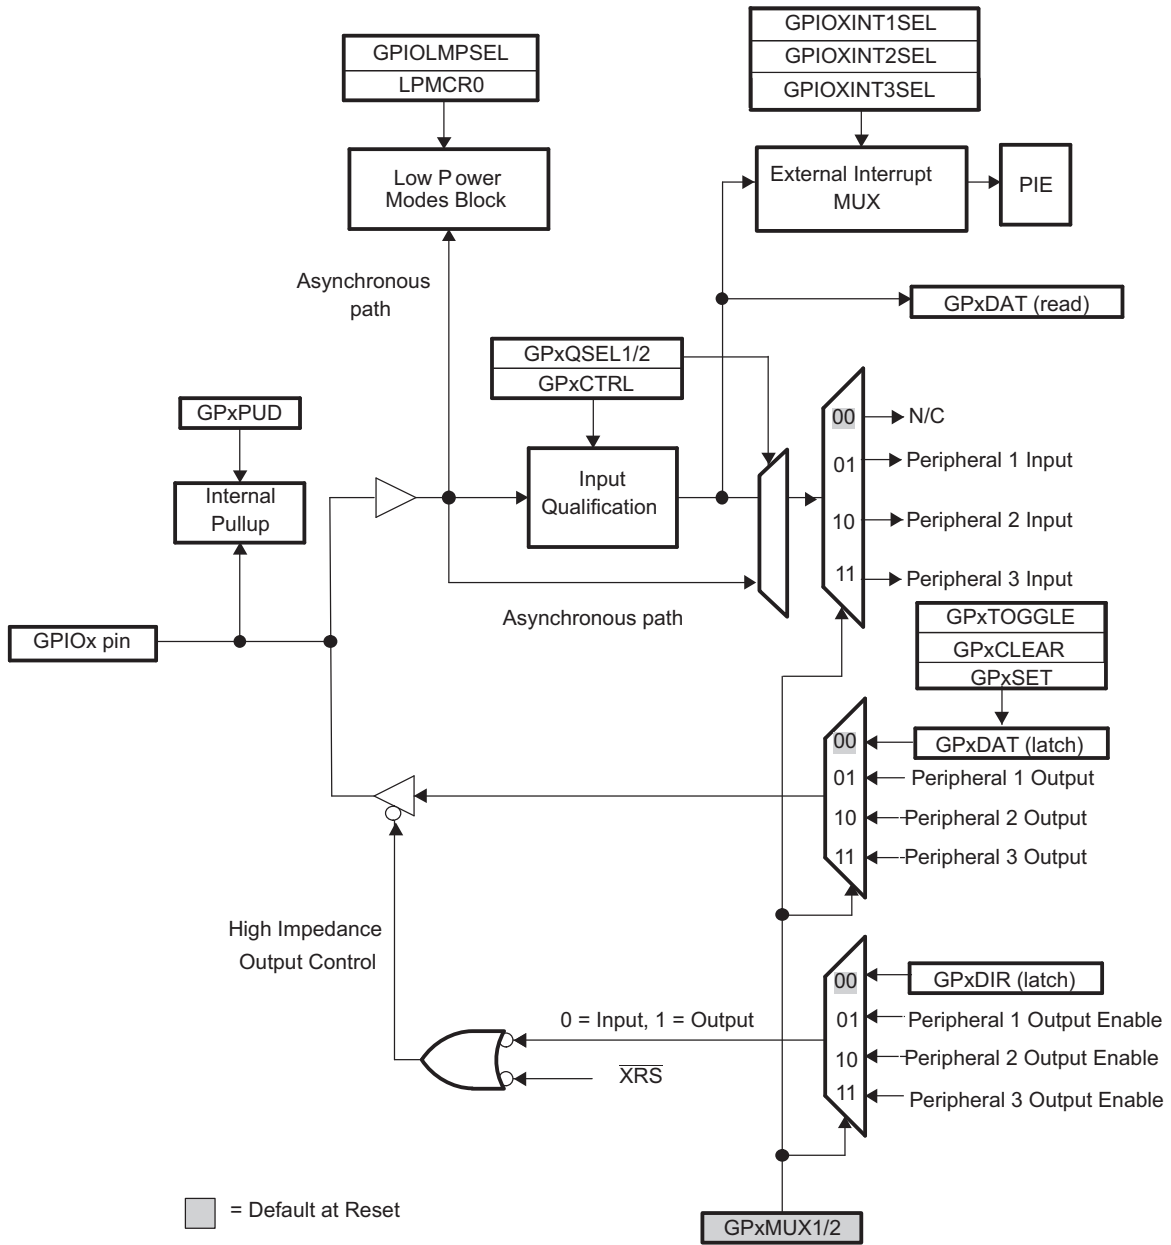

Figure 4-12. GPIO Multiplexing

ADVANCE INFORMATION

5 Device Support

Texas Instruments (TI) offers an extensive line of development tools for the C28x™ generation of MCUs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of 2802x-based applications:

Software Development Tools

- Code Composer Studio™ Integrated Development Environment (IDE)
 - C/C++ Compiler
 - Code generation tools
 - Assembler/Linker
 - Cycle Accurate Simulator
- Application algorithms
- Sample applications code

Hardware Development Tools

- Development and evaluation boards
- JTAG-based emulators - XDS510™ Class, XDS100
- Flash programming tools
- Power supply
- Documentation and cables

5.1 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ MCU devices and support tools. Each TMS320™ MCU commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS320F28025**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- TMS** Fully qualified production device

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing
- TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, DA) and temperature range (for example, A). [Figure 5-1](#) provides a legend for reading the complete device name for any family member.

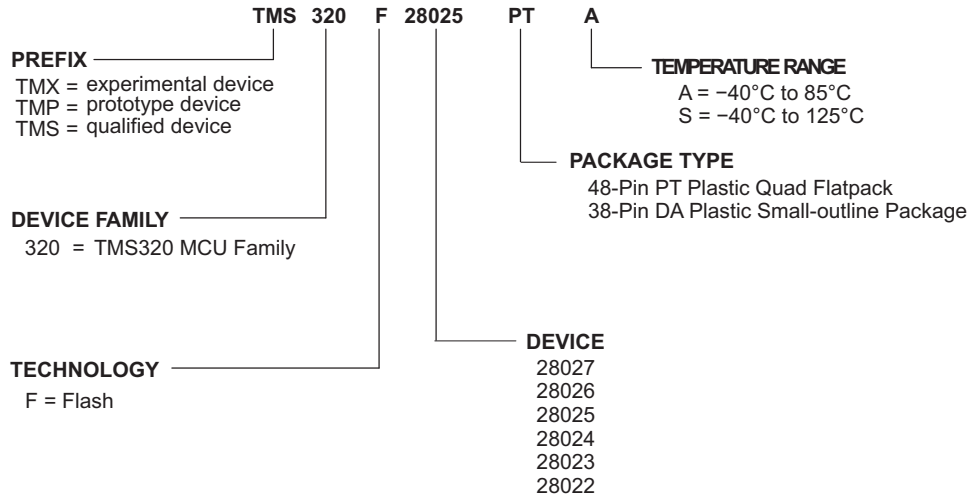

Figure 5-1. Device Nomenclature

5.2 Related Documentation

Extensive documentation supports all of the TMS320™ MCU family generations of devices from product announcement through applications development. The types of documentation available include: data sheets and data manuals, with design specifications; and hardware and software applications.

[Table 5-1](#) shows the peripheral reference guides appropriate for use with the devices in this data manual. See the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* ([SPRU566](#)) for more information on types of peripherals.

Table 5-1. TMS320F2802x Peripheral Selection Guide

| Peripheral | Lit. No. | Type ⁽¹⁾ | 28027, 28026, 28025, 28024, 28023, 28022 |
|--|-------------------------|---------------------|--|
| TMS320x2802x Piccolo System Control and Interrupts | SPRUFN3 | - | X |
| TMS320x2802x Piccolo Analog-to-Digital Converter and Comparator | SPRUGE5 | 3/0 ⁽²⁾ | X |
| TMS320x2802x Piccolo Serial Communications Interface (SCI) | SPRUGH1 | 0 | X |
| TMS320x2802x Piccolo Serial Peripheral Interface (SPI) | SPRUG71 | 1 | X |
| TMS320x2802x Piccolo Boot ROM | SPRUFN6 | - | X |
| TMS320x2802x Piccolo Enhanced Pulse Width Modulator Module (ePWM) | SPRUGE9 | 1 | X |
| TMS320x2802x Piccolo Enhanced Capture Module (eCAP) | SPRUFZ8 | 0 | X |
| TMS320x2802x Piccolo Inter-Integrated Circuit (I2C) | SPRUFZ9 | 0 | X |
| TMS320x2802x Piccolo High-Resolution Pulse-Width Modulator (HRPWM) | SPRUGE8 | 1 | X |

(1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the peripheral reference guides.

(2) The ADC module is Type 3 and the comparator module is Type 0.

The following documents can be downloaded from the TI website (www.ti.com):

Data Manual

SPRS523 [TMS320F28022, 28023, 28024, 28025, 28026, 28027 Microcontrollers \(MCUs\)](#) contains the pinout, signal descriptions, as well as electrical and timing specifications for the 2802x devices.

SPRZ292 [TMS320x28022, 28023, 28024, 28025, 28026, 28027 Piccolo DSP Silicon Errata](#) describes known advisories on silicon and provides workarounds.

CPU User's Guides

SPRU430 [TMS320C28x DSP CPU and Instruction Set Reference Guide](#) describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). It also describes emulation features available on these DSPs.

Peripheral Guides

SPRU566 [TMS320x28xx, 28xxx DSP Peripheral Reference Guide](#) describes the peripheral reference guides of the 28x digital signal processors (DSPs).

SPRUFN3 [TMS320x2802x Piccolo System Control and Interrupts Reference Guide](#) describes the various interrupts and system control features of the C2802x microcontrollers (MCUs).

SPRUFN6 [TMS320x2802x Piccolo Boot ROM Reference Guide](#) describes the purpose and features of the bootloader (factory-programmed boot-loading software) and provides examples of code. It also describes other contents of the device on-chip boot ROM and identifies where all of the information is located within that memory.

SPRUGE5 [TMS320x2802x Piccolo Analog-to-Digital Converter \(ADC\) and Comparator Reference Guide](#) describes how to configure and use the on-chip ADC module, which is a 12-bit pipelined ADC.

SPRUGE9 [TMS320x2802x Piccolo Enhanced Pulse Width Modulator \(ePWM\) Module Reference Guide](#) describes the main areas of the enhanced pulse width modulator that include digital motor control, switch mode power supply control, UPS (uninterruptible power supplies), and other forms of power conversion.

SPRUGE8 [TMS320x2802x Piccolo High-Resolution Pulse Width Modulator \(HRPWM\)](#) describes the operation of the high-resolution extension to the pulse width modulator (HRPWM).

SPRUGH1 [TMS320x2802x Piccolo Serial Communications Interface \(SCI\) Reference Guide](#) describes how to use the SCI.

SPRUFZ8 [TMS320x2802x Piccolo Enhanced Capture \(eCAP\) Module Reference Guide](#) describes the enhanced capture module. It includes the module description and registers.

SPRUG71 [TMS320x2802x Piccolo Serial Peripheral Interface \(SPI\) Reference Guide](#) describes the SPI - a high-speed synchronous serial input/output (I/O) port - that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmed bit-transfer rate.

SPRUFZ9 [TMS320x2802x Piccolo Inter-Integrated Circuit \(I2C\) Reference Guide](#) describes the features and operation of the inter-integrated circuit (I2C) module.

Tools Guides

SPRU513 [TMS320C28x Assembly Language Tools User's Guide](#) describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

SPRU514 [TMS320C28x Optimizing C Compiler User's Guide](#) describes the TMS320C28x™ C/C++

compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.

- SPRU608** [The TMS320C28x Instruction Set Simulator Technical Overview](#) describes the simulator, available within the Code Composer Studio for TMS320C2000 IDE, that simulates the instruction set of the C28x™ core.

6 Electrical Specifications

6.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

Unless otherwise noted, the list of absolute maximum ratings are specified over operating temperature ranges.

| | | |
|--|---------------------------|------------------|
| Supply voltage range, V_{DDIO} (I/O and Flash) | with respect to V_{SS} | – 0.3 V to 4.6 V |
| Supply voltage range, V_{DD} | with respect to V_{SS} | – 0.3 V to 2.5 V |
| Analog voltage range, V_{DDA} | with respect to V_{SSA} | – 0.3 V to 4.6 V |
| Input voltage range, V_{IN} (3.3 V) | | – 0.3 V to 4.6 V |
| Output voltage range, V_O | | – 0.3 V to 4.0 V |
| Input clamp current, I_{IK} ($V_{IN} < 0$ or $V_{IN} > V_{DDIO}$) ⁽³⁾ | | ± 20 mA |
| Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{DDIO}$) | | ± 20 mA |
| Operating ambient temperature ranges | T_A : A version | – 40°C to 85°C |
| | T_A : S version | – 40°C to 125°C |
| Junction temperature range, T_j | | – 40°C to 150°C |
| Storage temperature range, T_{stg} | | – 65°C to 150°C |

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 6.2](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS} , unless otherwise noted.
- (3) Continuous clamp current per pin is ± 2 mA.

6.2 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|---|----------------------------|------|-----|------------|------|
| Device supply voltage, I/O, V_{DDIO} | | 2.97 | 3.3 | 3.63 | V |
| Device supply voltage CPU, V_{DD} (When internal VREG is disabled and 1.8 V is supplied externally) | | 1.71 | 1.8 | 1.995 | v |
| Supply ground, V_{SS} | | | 0 | | V |
| Analog supply voltage, V_{DDA} | | 2.97 | 3.3 | 3.63 | V |
| Analog ground, V_{SSA} | | | 0 | | V |
| Device clock frequency (system clock) | 28022, 28023, 28024, 28025 | 2 | | 40 | MHz |
| | 28026, 28027 | 2 | | 60 | |
| High-level input voltage, V_{IH} (3.3 V) | | 2 | | V_{DDIO} | V |
| Low-level input voltage, V_{IL} (3.3 V) | | | | 0.8 | V |
| High-level output source current, $V_{OH} = V_{OH(MIN)}$, I_{OH} | All GPIO pins | | – 4 | | mA |
| | Group 2 ⁽¹⁾ | | – 8 | | mA |
| Low-level output sink current, $V_{OL} = V_{OL(MAX)}$, I_{OL} | All GPIO pins | | 4 | | mA |
| | Group 2 ⁽¹⁾ | | 8 | | mA |
| Ambient temperature, T_A | T_A : A version | – 40 | | 85 | °C |
| | T_A : S version | – 40 | | 125 | °C |
| Junction temperature, T_j | | | | 125 | °C |

- (1) Group 2 pins are as follows: GPIO16, GPIO17, GPIO18, GPIO19, GPIO28, GPIO29, GPIO36, GPIO37

6.3 Electrical Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT | |
|-----------------|---|---|--|--------------------------|-----|-------|------|----|
| V _{OH} | High-level output voltage | I _{OH} = I _{OH} MAX | | 2.4 | | | V | |
| | | I _{OH} = 50 μA | | V _{DDIO} – 0.2 | | | | |
| V _{OL} | Low-level output voltage | I _{OL} = I _{OL} MAX | | 0.4 | | | V | |
| I _{IL} | Input current (low level) | Pin with pullup enabled | V _{DDIO} = 3.3 V, V _{IN} = 0 V | All I/Os (including XRS) | | – 100 | | μA |
| | | Pin with pulldown enabled | V _{DDIO} = 3.3 V, V _{IN} = 0 V | | | ± 2 | | |
| I _{IH} | Input current (high level) | Pin with pullup enabled | V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO} | | | ± 2 | | μA |
| | | Pin with pulldown enabled | V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO} | | | 100 | | |
| I _{OZ} | Output current, pullup or pulldown disabled | V _O = V _{DDIO} or 0 V | | | | ± 2 | | μA |
| C _I | Input capacitance | | | | | 2 | | pF |

6.4 Current Consumption

Table 6-1. TMS320F2802x Current Consumption at 40-MHz SYSCLKOUT

| MODE | TEST CONDITIONS | VREG ENABLED | | | | VREG DISABLED | | | | | |
|---------------------|---|--------------------|-----|--------------------|-----|--------------------|-----|----------------------------------|-----|---------------------------------|-----|
| | | I _{DDIO} | | I _{DDA} | | I _{DD} | | I _{DDIO} ⁽¹⁾ | | I _{DDA} ⁽²⁾ | |
| | | TYP ⁽³⁾ | MAX | TYP ⁽³⁾ | MAX | TYP ⁽³⁾ | MAX | TYP ⁽³⁾ | MAX | TYP | MAX |
| Operational (Flash) | The following peripheral clocks are enabled: <ul style="list-style-type: none"> ePWM1/2/3/4 eCAP SCI-A SPI-A ADC I2C COMP1/2 CPU Timer0/1/2 All PWM pins are toggled at 40 kHz. All I/O pins are left unconnected. ⁽⁴⁾ Code is running out of flash with 1 wait-state. XCLKOUT is turned off. | 75 mA | | 13 mA | | 60 mA | | 15 mA | | 15 mA | |
| IDLE | Flash is powered down. XCLKOUT is turned off. All peripheral clocks are off. ⁽⁵⁾ | 14 mA | | 100 μA | | 15 mA | | 200 μA | | 100 μA | |
| STANDBY | Flash is powered down. Peripheral clocks are off. | 4 mA | | 25 μA | | 4 mA | | 200 μA | | 25 μA | |
| HALT | Flash is powered down. Peripheral clocks are off. Input clock is disabled. | 100 μA | | 25 μA | | 50 μA | | 50 μA | | 25 μA | |

- (1) I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- (2) In order to realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.
- (3) The TYP numbers are applicable over room temperature and nominal voltage.
- (4) The following is done in a loop:
 - Data is continuously transmitted out of SPI-A and SCI-A ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1/2 are continuously switching voltages.
 - GPIO17 is toggled.
- (5) If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.

Table 6-2. TMS320F2802x Current Consumption at 60-MHz SYSCLKOUT

| MODE | TEST CONDITIONS | VREG ENABLED | | | | VREG DISABLED | | | | | |
|------------------------|--|--------------------|-----|--------------------|-----|--------------------|-----|----------------------------------|-----|---------------------------------|-----|
| | | I _{DDIO} | | I _{DDA} | | I _{DD} | | I _{DDIO} ⁽¹⁾ | | I _{DDA} ⁽²⁾ | |

| Operation I (Flash) | The following peripheral clocks are enabled: <ul style="list-style-type: none"> ePWM1/2/3/4 eCAP1 SCI-A SPI-A ADC I2C COMP1/2 CPU-TIMER0/1/2 All PWM pins are toggled at 60 kHz. All I/O pins are left unconnected. ⁽⁴⁾⁽⁵⁾ Code is running out of flash with 2 wait-states. XCLKOUT is turned off. | 92 mA | | 13 mA | | 76 mA | | 15 mA | | 13 mA | |
| IDLE | Flash is powered down. XCLKOUT is turned off. All peripheral clocks are turned off. | 20 mA | | 100 μA | | 20 mA | | 200 μA | | 100 μA | |
| STANDBY | Flash is powered down. Peripheral clocks are off. | 5 mA | | 25 μA | | 4 mA | | 200 μA | | 25 μA | |
| HALT | Flash is powered down. Peripheral clocks are off. Input clock is disabled. | 100 μA | | 25 μA | | 50 μA | | 50 μA | | 25 μA | |

- (1) I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- (2) In order to realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.
- (3) The TYP numbers are applicable over room temperature and nominal voltage.
- (4) The following is done in a loop:
 - Data is continuously transmitted out of SPI-A and SCI-A ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1/2 are continuously switching voltages.
 - GPIO17 is toggled.
- (5) If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.

NOTE

The peripheral - I/O multiplexing implemented in the device prevents all available peripherals from being used at the same time. This is because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If this is done, the current drawn by the device will be more than the numbers specified in the current consumption tables.

6.4.1 Reducing Current Consumption

The 2802x devices incorporate a method to reduce the device current consumption. Since each peripheral unit has an individual clock-enable bit, significant reduction in current consumption can be achieved by turning off the clock to any peripheral module that is not used in a given application. Furthermore, any one of the three low-power modes could be taken advantage of to reduce the current consumption even further. Table 6-3 indicates the typical reduction in current consumption achieved by turning off the clocks.

Table 6-3. Typical Current Consumption by Various Peripherals (at 60 MHz)⁽¹⁾

| PERIPHERAL MODULE ⁽²⁾ | I _{DD} CURRENT REDUCTION (mA) |
|----------------------------------|--|
| ADC | 2 ⁽³⁾ |
| I2C | 3 |
| ePWM | 2 |
| eCAP | 2 |
| SCI | 2 |
| SPI | 2 |
| COMP/DAC | 1 |
| HRPWM | 3 |
| CPU-TIMER | 1 |
| Internal zero-pin oscillator | 0.5 |

- (1) All peripheral clocks are disabled upon reset. Writing to/reading from peripheral registers is possible only after the peripheral clocks are turned on.
- (2) For peripherals with multiple instances, the current quoted is per module. For example, the 2 mA value quoted for ePWM is for one ePWM module.
- (3) This number represents the current drawn by the digital portion of the ADC module. Turning off the clock to the ADC module results in the elimination of the current drawn by the analog portion of the ADC (I_{DDA}) as well.

NOTE

I_{DDIO} current consumption is reduced by 15 mA (typical) when XCLKOUT is turned off.

NOTE

The baseline I_{DD} current (current when the core is executing a dummy loop with no peripherals enabled) is 45 mA, typical. To arrive at the I_{DD} current for a given application, the current-drawn by the peripherals (enabled by that application) must be added to the baseline I_{DD} current.

Following are other methods to reduce power consumption further:

- The flash module may be powered down if code is run off SARAM. This results in a current reduction of 18 mA (typical) in the V_{DD} rail and 13 mA (typical) in the V_{DDIO} rail.
- Savings in I_{DDIO} may be realized by disabling the pullups on pins that assume an output function.

6.4.2 Current Consumption Graphs (VREG Enabled)

Figure 6-1. Typical Operational Current Versus Frequency (F2802x)

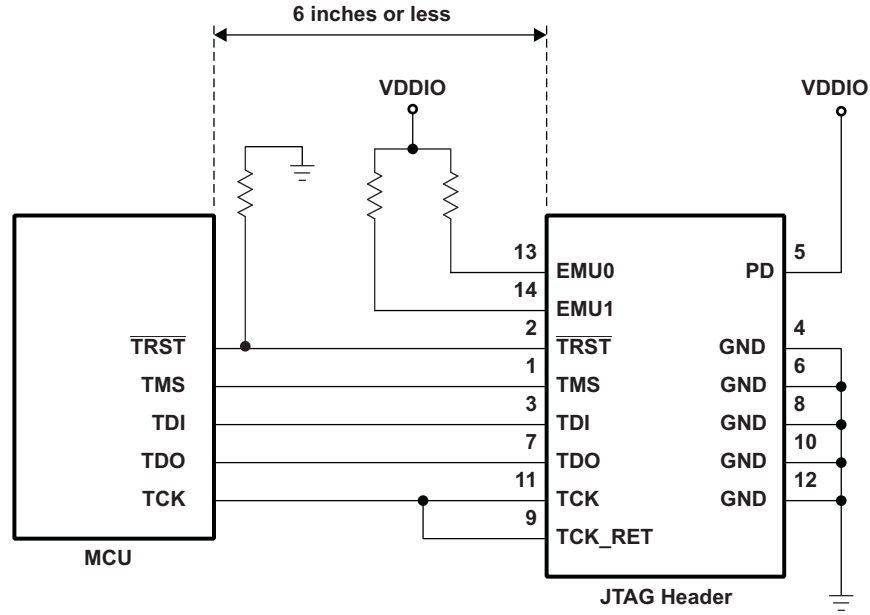

Figure 6-2. Typical Operational Power Versus Frequency (F2802x)

6.5 Emulator Connection Without Signal Buffering for the MCU

Figure 6-3 shows the connection between the MCU and JTAG header for a single-processor configuration. If the distance between the JTAG header and the MCU is greater than 6 inches, the emulation signals must be buffered. If the distance is less than 6 inches, buffering is typically not needed. Figure 6-3 shows the simpler, no-buffering situation. For the pullup/pulldown resistor values, see the pin description section.

A. See [Figure 4-11](#) for JTAG/GPIO multiplexing.

Figure 6-3. Emulator Connection Without Signal Buffering for the MCU

NOTE

The 2802x devices do not have EMU0/EMU1 pins. For designs that have a JTAG Header on-board, the EMU0/EMU1 pins on the header must be tied to V_{DDIO} through a 4.7 k Ω (typical) resistor.

6.6 Timing Parameter Symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

| Lowercase subscripts and their meanings: | Letters and symbols and their meanings: |
|--|---|
| a access time | H High |
| c cycle time (period) | L Low |
| d delay time | V Valid |
| f fall time | X Unknown, changing, or don't care level |
| h hold time | Z High impedance |
| r rise time | |
| su setup time | |
| t transition time | |
| v valid time | |
| w pulse duration (width) | |

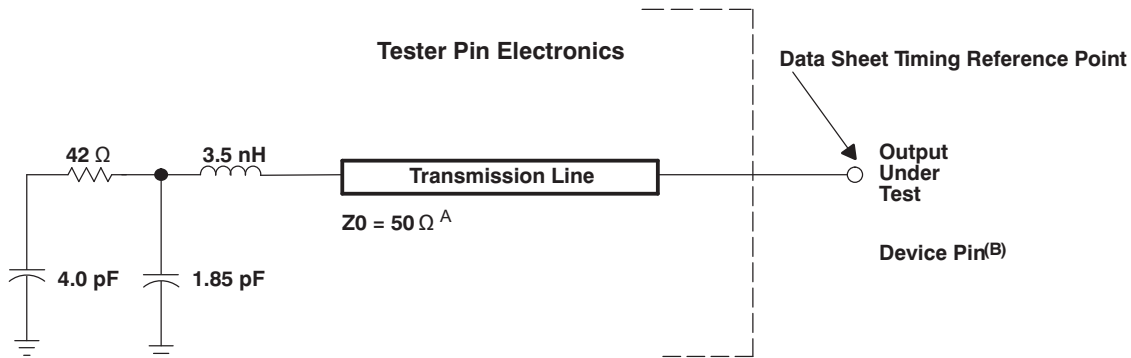

6.6.1 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

6.6.2 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

- A. Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.
- B. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

Figure 6-4. 3.3-V Test Load Circuit

6.6.3 Device Clock Table

This section provides the timing requirements and switching characteristics for the various clock options available on the 2802x MCUs. [Table 6-4](#) and [Table 6-5](#) list the cycle times of various clocks.

Table 6-4. 2802x Clock Table and Nomenclature (40-MHz Devices)

| | | MIN | NOM | MAX | UNIT |
|--|------------------------------|------|--------------------|------|------|
| Internal zero-pin oscillator 1 (INTOSC1) | $t_{c(ZPOSC1)}$, Cycle time | | 100 | | ns |
| | Frequency | | 10 | | MHz |
| Internal zero-pin oscillator 2 (INTOSC2) | $t_{c(ZPOSC2)}$, Cycle time | | 100 | | ns |
| | Frequency | | 10 | | MHz |
| On-chip crystal oscillator (X1/X2 pins) | $t_{c(OSC)}$, Cycle time | 28.6 | | 50 | ns |
| | Frequency | 20 | | 35 | MHz |
| XCLKIN | $t_{c(CI)}$, Cycle time | 25 | | 250 | ns |
| | Frequency | 4 | | 40 | MHz |
| SYSCLKOUT | $t_{c(SCO)}$, Cycle time | 25 | | 500 | ns |
| | Frequency | 2 | | 40 | MHz |
| XCLKOUT | $t_{c(XCO)}$, Cycle time | 50 | | 2000 | ns |
| | Frequency | 0.5 | | 20 | MHz |
| LSPCLK ⁽¹⁾ | $t_{c(LCO)}$, Cycle time | 25 | 100 ⁽²⁾ | | ns |
| | Frequency | | 10 ⁽²⁾ | 40 | MHz |
| ADC clock | $t_{c(ADCCLK)}$, Cycle time | 25 | | | ns |
| | Frequency | | | 40 | MHz |

- (1) Lower LSPCLK will reduce device power consumption.
(2) This is the default reset value if SYSCLKOUT = 40 MHz.

Table 6-5. 2802x Clock Table and Nomenclature (60-MHz Devices)

| | | MIN | NOM | MAX | UNIT |
|--|------------------------------|-------|---------------------|------|------|
| Internal zero-pin oscillator 1 (INTOSC1) | $t_{c(ZPOSC1)}$, Cycle time | | 100 | | ns |
| | Frequency | | 10 | | MHz |
| Internal zero-pin oscillator 2 (INTOSC2) | $t_{c(ZPOSC2)}$, Cycle time | | 100 | | ns |
| | Frequency | | 10 | | MHz |
| On-chip crystal oscillator (X1/X2 pins) | $t_{c(OSC)}$, Cycle time | 28.6 | | 50 | ns |
| | Frequency | 20 | | 35 | MHz |
| XCLKIN | $t_{c(CI)}$, Cycle time | 16.67 | | 250 | ns |
| | Frequency | 4 | | 60 | MHz |
| SYSCLKOUT | $t_{c(SCO)}$, Cycle time | 16.67 | | 500 | ns |
| | Frequency | 2 | | 60 | MHz |
| XCLKOUT | $t_{c(XCO)}$, Cycle time | 50 | | 2000 | ns |
| | Frequency | 0.5 | | 20 | MHz |
| LSPCLK ⁽¹⁾ | $t_{c(LCO)}$, Cycle time | 16.67 | 66.7 ⁽²⁾ | | ns |
| | Frequency | | 15 ⁽²⁾ | 60 | MHz |
| ADC clock | $t_{c(ADCCLK)}$, Cycle time | 16.67 | | | ns |
| | Frequency | | | 60 | MHz |

- (1) Lower LSPCLK will reduce device power consumption.
(2) This is the default reset value if SYSCLKOUT = 60 MHz.

6.7 Clock Requirements and Characteristics

Table 6-6. Input Clock Frequency

| PARAMETER | | MIN | TYP | MAX | UNIT | |
|---------------|---|---|---------------|-----|------|-----|
| f_x | Input clock frequency | Resonator (X1/X2) | | 20 | 35 | MHz |
| | | Crystal (X1/X2) | | 20 | 35 | |
| | | External oscillator/clock source (XCLKIN pin) | 40-MHz device | 4 | 40 | |
| 60-MHz device | 4 | | 60 | | | |
| f_l | Limp mode SYSCLOCKOUT frequency range (with /2 enabled) | | 1-5 | | MHz | |

Table 6-7. XCLKIN Timing Requirements - PLL Enabled

| NO. | | MIN | MAX | UNIT |
|-----|---|------|-----|------|
| C8 | $t_{c(CI)}$ Cycle time, XCLKIN | 33.3 | 200 | ns |
| C9 | $t_{f(CI)}$ Fall time, XCLKIN | | 6 | ns |
| C10 | $t_{r(CI)}$ Rise time, XCLKIN | | 6 | ns |
| C11 | $t_{w(CIL)}$ Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$ | 45 | 55 | % |
| C12 | $t_{w(CIH)}$ Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$ | 45 | 55 | % |

Table 6-8. XCLKIN Timing Requirements - PLL Disabled

| NO. | | MIN | MAX | UNIT | |
|-----|---|------------------|-------|------|----|
| C8 | $t_{c(CI)}$ Cycle time, XCLKIN | 40-MHz device | 25 | 250 | ns |
| | | 60-MHz device | 16.67 | 250 | |
| C9 | $t_{f(CI)}$ Fall time, XCLKIN | Up to 20 MHz | | 6 | ns |
| | | 20 MHz to 60 MHz | | 2 | |
| C10 | $t_{r(CI)}$ Rise time, XCLKIN | Up to 20 MHz | | 6 | ns |
| | | 20 MHz to 60 MHz | | 2 | |
| C11 | $t_{w(CIL)}$ Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$ | 45 | 55 | % | |
| C12 | $t_{w(CIH)}$ Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$ | 45 | 55 | % | |

The possible configuration modes are shown in [Table 3-16](#).

Table 6-9. XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)⁽¹⁾⁽²⁾

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
|-----|---------------|------------------------------|-----|-----|------------------|------|
| C1 | $t_{c(XCO)}$ | 40-MHz device | 50 | | | ns |
| | | 60-MHz device | 50 | | | |
| C3 | $t_{f(XCO)}$ | Fall time, XCLKOUT | | 2 | | ns |
| C4 | $t_{r(XCO)}$ | Rise time, XCLKOUT | | 2 | | ns |
| C5 | $t_{w(XCOL)}$ | Pulse duration, XCLKOUT low | H-2 | | H+2 | ns |
| C6 | $t_{w(XCOH)}$ | Pulse duration, XCLKOUT high | H-2 | | H+2 | ns |
| | t_p | PLL lock time | | | 1 ⁽³⁾ | ms |

(1) A load of 40 pF is assumed for these parameters.

(2) $H = 0.5t_{c(XCO)}$

(3) The PLLLOCKPRD register must be updated based on the number of OSCCLK cycles.

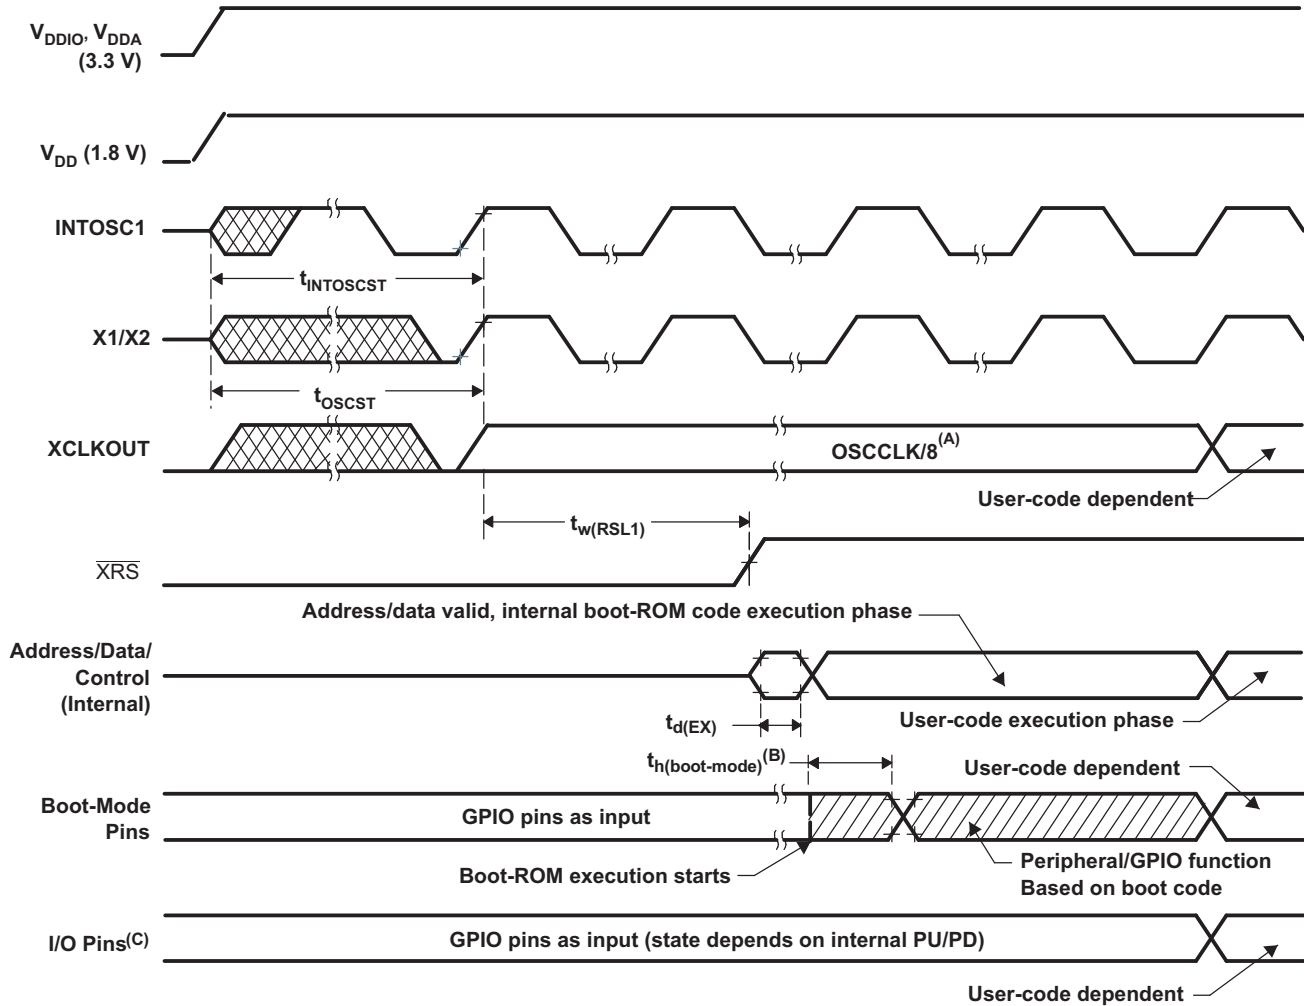

- A. The relationship of XCLKIN to XCLKOUT depends on the divide factor chosen. The waveform relationship shown is intended to illustrate the timing parameters only and may differ based on actual configuration.
- B. XCLKOUT configured to reflect SYSCLKOUT.

Figure 6-5. Clock Timing

6.8 Power Sequencing

There is no power sequencing requirement. However, it is recommended that no voltage larger than a diode drop (0.7 V) should be applied to any pin prior to powering up the device. Voltages applied to pins on an unpowered device can bias internal p-n junctions in unintended ways and produce unpredictable results.

- A. Upon power up, SYSCLKOUT is OSCCLK/2. Since the XCLKOUTDIV bits in the XCLK register come up with a reset state of 0, SYSCLKOUT is further divided by 4 before it appears at XCLKOUT. This explains why XCLKOUT = OSCCLK/8 during this phase.
- B. After reset, the boot ROM code samples Boot Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If boot ROM code executes after power-on conditions (in debugger environment), the boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.
- C. See Section 6.8 for requirements to ensure a high-impedance state for GPIO pins during power-up.

Figure 6-6. Power-on Reset

Table 6-10. Reset (\overline{XRS}) Timing Requirements

| | | MIN | NOM | MAX | UNIT |
|---------------------------|--|-----|-------------------------|-----|--------|
| $t_{h(\text{boot-mode})}$ | Hold time for boot-mode pins | TBD | | | cycles |
| $t_{w(\text{RSL2})}$ | Pulse duration, \overline{XRS} low on warm reset | | $8t_{c(\text{OSCCLK})}$ | | cycles |

Table 6-11. Reset (\overline{XRS}) Switching Characteristics

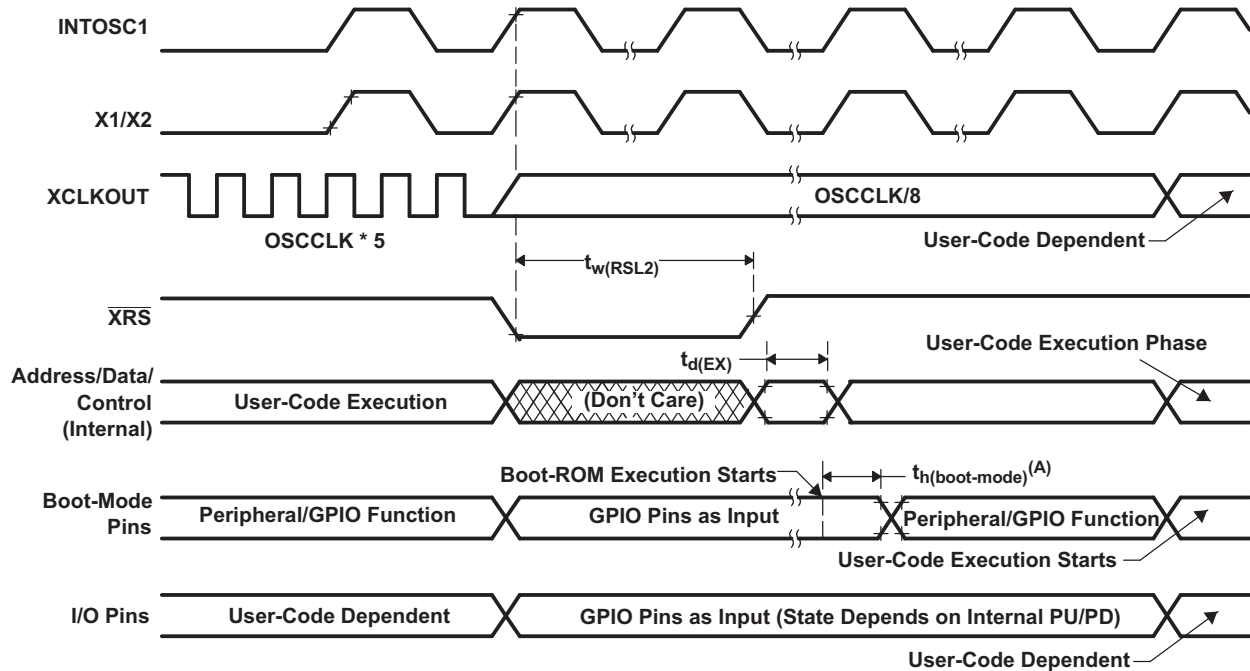

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|----------------------|---|-----|---------------------------|-----|---------------|
| $t_{w(\text{RSL1})}$ | Pulse duration, \overline{XRS} driven by device | | 600 | | μs |
| $t_{w(\text{WDRS})}$ | Pulse duration, reset pulse generated by watchdog | | $512t_{c(\text{OSCCLK})}$ | | cycles |

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------------|--|-----|-----------------|-----|---------|
| $t_{d(EX)}$ | Delay time, address/data valid after \overline{XRS} high | | $32t_c(OSCCLK)$ | | cycles |
| $t_{INTOSCST}$ | Start up time, internal zero-pin oscillator | | 3 | | μ s |
| $t_{OSCST}^{(1)}$ | On-chip crystal, oscillator start-up time | 1 | 10 | | ms |

(1) Dependent on crystal/resonator and board design.

- A. After reset, the Boot ROM code samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.

Figure 6-7. Warm Reset

Figure 6-8 shows an example for the effect of writing into PLLCR register. In the first phase, PLLCR = 0x0004 and SYSCLKOUT = OSCCLK x 2. The PLLCR is then written with 0x0008. Right after the PLLCR register is written, the PLL lock-up phase begins. During this phase, SYSCLKOUT = OSCCLK/2. After the PLL lock-up is complete, SYSCLKOUT reflects the new operating frequency, OSCCLK x 4.

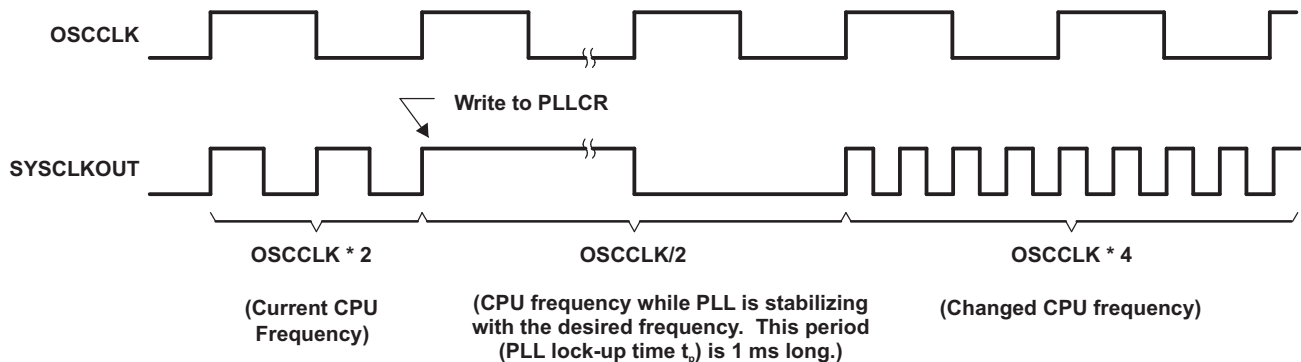

Figure 6-8. Example of Effect of Writing Into PLLCR Register

6.9 General-Purpose Input/Output (GPIO)

6.9.1 GPIO - Output Timing

Table 6-12. General-Purpose Output Switching Characteristics

| PARAMETER | | | MIN | MAX | UNIT |
|--------------|---------------------------------------|-----------|-----|-----|------|
| $t_{r(GPO)}$ | Rise time, GPIO switching low to high | All GPIOs | | 8 | ns |
| $t_{f(GPO)}$ | Fall time, GPIO switching high to low | All GPIOs | | 8 | ns |
| t_{tGPO} | Toggling frequency | | | 20 | MHz |

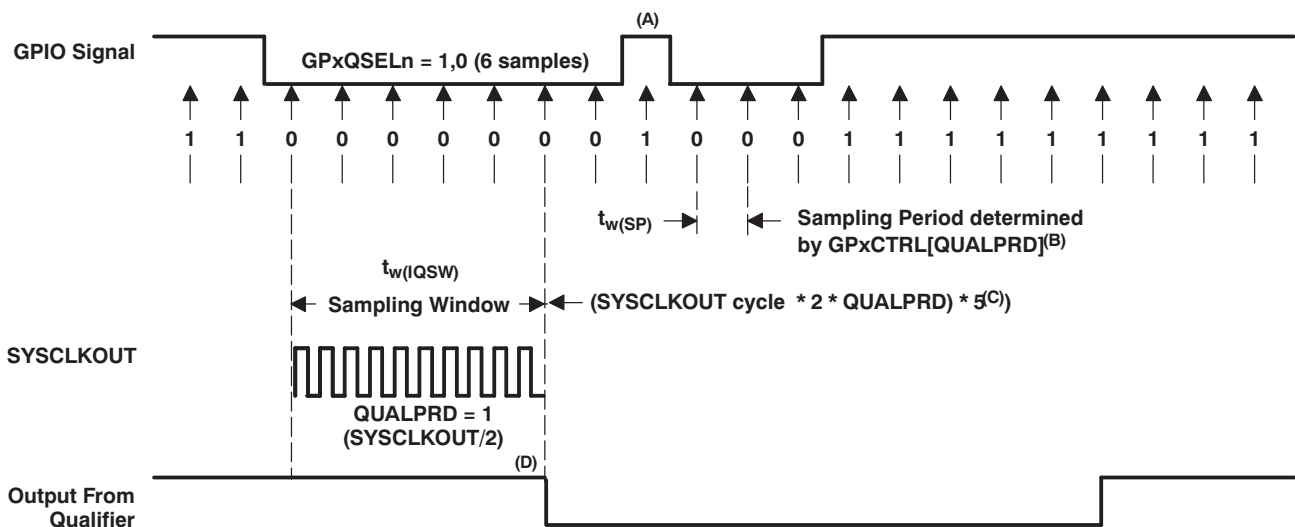

Figure 6-9. General-Purpose Output Timing

6.9.2 GPIO - Input Timing

- This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period is 2n SYSCLKOUT cycles (i.e., at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.
- The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. This would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, a 13-SYSCLKOUT-wide pulse ensures reliable recognition.

Figure 6-10. Sampling Mode

Table 6-13. General-Purpose Input Timing Requirements

| | | | MIN | MAX | UNIT |
|-------------|-----------------|------------------|-----|-------------------------|--------|
| $t_{w(SP)}$ | Sampling period | QUALPRD = 0 | | $1t_{c(SCO)}$ | cycles |
| | | QUALPRD \neq 0 | | $2t_{c(SCO)} * QUALPRD$ | cycles |

Table 6-13. General-Purpose Input Timing Requirements (continued)

| | | MIN | MAX | UNIT |
|--------------------|---------------------------------|-----------------------------|---|--------|
| $t_{w(IQSW)}$ | Input qualifier sampling window | $t_{w(SP)} * (n^{(1)} - 1)$ | | cycles |
| $t_{w(GPI)}^{(2)}$ | Pulse duration, GPIO low/high | Synchronous mode | $2t_{c(SCO)}$ | cycles |
| | | With input qualifier | $t_{w(IQSW)} + t_{w(SP)} + 1t_{c(SCO)}$ | cycles |

(1) "n" represents the number of qualification samples as defined by GPxQSELn register.

(2) For $t_{w(GPI)}$, pulse width is measured from V_{IL} to V_{IL} for an active low signal and V_{IH} to V_{IH} for an active high signal.

6.9.3 Sampling Window Width for Input Signals

The following section summarizes the sampling window width for input signals for various input qualifier configurations.

Sampling frequency denotes how often a signal is sampled with respect to SYSCLKOUT.

Sampling frequency = $\text{SYSCLKOUT} / (2 * \text{QUALPRD})$, if $\text{QUALPRD} \neq 0$

Sampling frequency = SYSCLKOUT , if $\text{QUALPRD} = 0$

Sampling period = $\text{SYSCLKOUT cycle} * 2 * \text{QUALPRD}$, if $\text{QUALPRD} \neq 0$

In the above equations, SYSCLKOUT cycle indicates the time period of SYSCLKOUT.

Sampling period = SYSCLKOUT cycle , if $\text{QUALPRD} = 0$

In a given sampling window, either 3 or 6 samples of the input signal are taken to determine the validity of the signal. This is determined by the value written to GPxQSELn register.

Case 1:

Qualification using 3 samples

Sampling window width = $(\text{SYSCLKOUT cycle} * 2 * \text{QUALPRD}) * 2$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) * 2$, if $\text{QUALPRD} = 0$

Case 2:

Qualification using 6 samples

Sampling window width = $(\text{SYSCLKOUT cycle} * 2 * \text{QUALPRD}) * 5$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) * 5$, if $\text{QUALPRD} = 0$

Figure 6-11. General-Purpose Input Timing

6.9.4 Low-Power Mode Wakeup Timing

Table 6-14 shows the timing requirements, Table 6-15 shows the switching characteristics, and Figure 6-12 shows the timing diagram for IDLE mode.

Table 6-14. IDLE Mode Timing Requirements⁽¹⁾

| | | MIN NOM MAX | | | UNIT |
|--------------------------|---|-------------------------|---|--|--------|
| $t_{w(\text{WAKE-INT})}$ | Pulse duration, external wake-up signal | Without input qualifier | $2t_{c(\text{SCO})}$ | | cycles |
| | | With input qualifier | $5t_{c(\text{SCO})} + t_{w(\text{IQSW})}$ | | |

(1) For an explanation of the input qualifier parameters, see Table 6-13.

Table 6-15. IDLE Mode Switching Characteristics⁽¹⁾

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---------------------------|---|-------------------------|-----|--|--|--------|
| $t_{d(\text{WAKE-IDLE})}$ | Delay time, external wake signal to program execution resume ⁽²⁾ | | | | | |
| | • Wake-up from Flash – Flash module in active state | Without input qualifier | | | $20t_{c(\text{SCO})}$ | cycles |
| | | With input qualifier | | | $20t_{c(\text{SCO})} + t_{w(\text{IQSW})}$ | |
| | • Wake-up from Flash – Flash module in sleep state | Without input qualifier | | | $1050t_{c(\text{SCO})}$ | cycles |
| | | With input qualifier | | | $1050t_{c(\text{SCO})} + t_{w(\text{IQSW})}$ | |
| | • Wake-up from SARAM | Without input qualifier | | | $20t_{c(\text{SCO})}$ | cycles |
| With input qualifier | | | | $20t_{c(\text{SCO})} + t_{w(\text{IQSW})}$ | | |

(1) For an explanation of the input qualifier parameters, see Table 6-13.

(2) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up) signal involves additional latency.

A. WAKE INT can be any enabled interrupt, $\overline{\text{WDINT}}$ or $\overline{\text{XRS}}$.

Figure 6-12. IDLE Entry and Exit Timing

Table 6-16. STANDBY Mode Timing Requirements

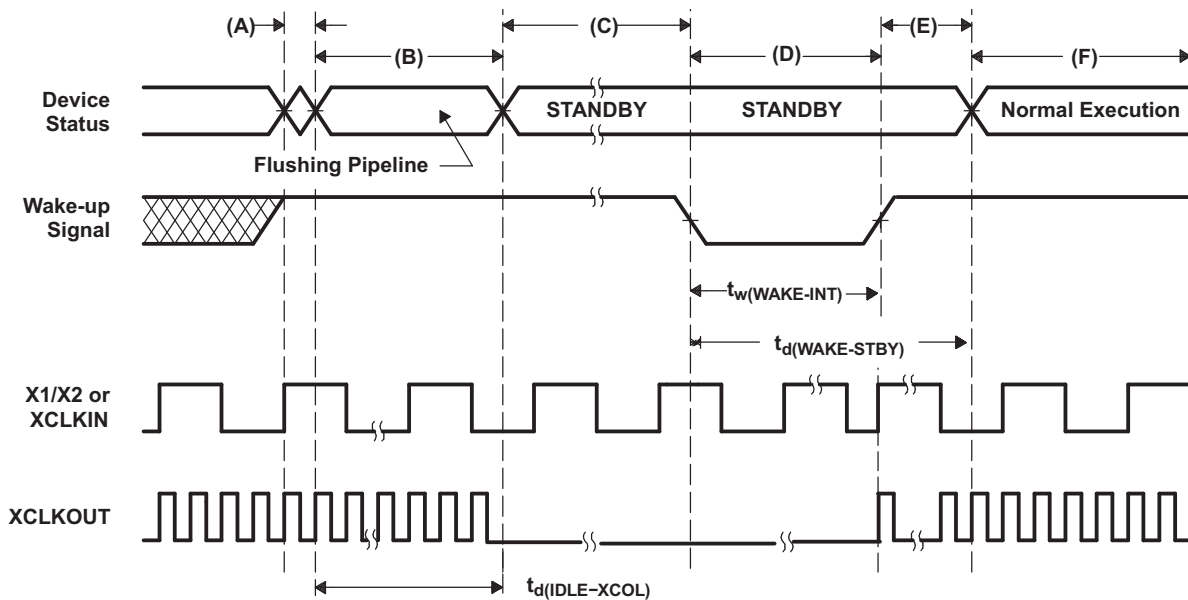

| | | TEST CONDITIONS | MIN | NOM | MAX | UNIT |
|--------------------------|---|---|---|-----|-----|--------|
| $t_{w(\text{WAKE-INT})}$ | Pulse duration, external wake-up signal | Without input qualification | $3t_{c(\text{OSCCLK})}$ | | | cycles |
| | | With input qualification ⁽¹⁾ | $(2 + \text{QUALSTDBY}) * t_{c(\text{OSCCLK})}$ | | | |

(1) QUALSTDBY is a 6-bit field in the LPMCR0 register.

Table 6-17. STANDBY Mode Switching Characteristics

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT | |
|---------------------------|---|-------------------------|-----------------------|---|--|--------|
| $t_{d(\text{IDLE-XCOL})}$ | Delay time, IDLE instruction executed to XCLKOUT low | | $32t_{c(\text{SCO})}$ | | cycles | |
| $t_{d(\text{WAKE-STBY})}$ | Delay time, external wake signal to program execution resume ⁽¹⁾ | | | $45t_{c(\text{SCO})}$ | cycles | |
| | • Wake up from flash – Flash module in active state | Without input qualifier | | | $100t_{c(\text{SCO})}$ | cycles |
| | | With input qualifier | | | $100t_{c(\text{SCO})} + t_w(\text{WAKE-INT})$ | |
| | • Wake up from flash – Flash module in sleep state | Without input qualifier | | | $1125t_{c(\text{SCO})}$ | cycles |
| | | With input qualifier | | | $1125t_{c(\text{SCO})} + t_w(\text{WAKE-INT})$ | |
| | • Wake up from SARAM | Without input qualifier | | | $100t_{c(\text{SCO})}$ | cycles |
| With input qualifier | | | | $100t_{c(\text{SCO})} + t_w(\text{WAKE-INT})$ | | |

(1) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up signal) involves additional latency.

- A. IDLE instruction is executed to put the device into STANDBY mode.
- B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for approximately 32 cycles before being turned off. This 32-cycle delay enables the CPU pipe and any other pending operations to flush properly.
- C. Clock to the peripherals are turned off. However, the PLL and watchdog are not shut down. The device is now in STANDBY mode.
- D. The external wake-up signal is driven active.
- E. After a latency period, the STANDBY mode is exited.
- F. Normal execution resumes. The device will respond to the interrupt (if enabled).

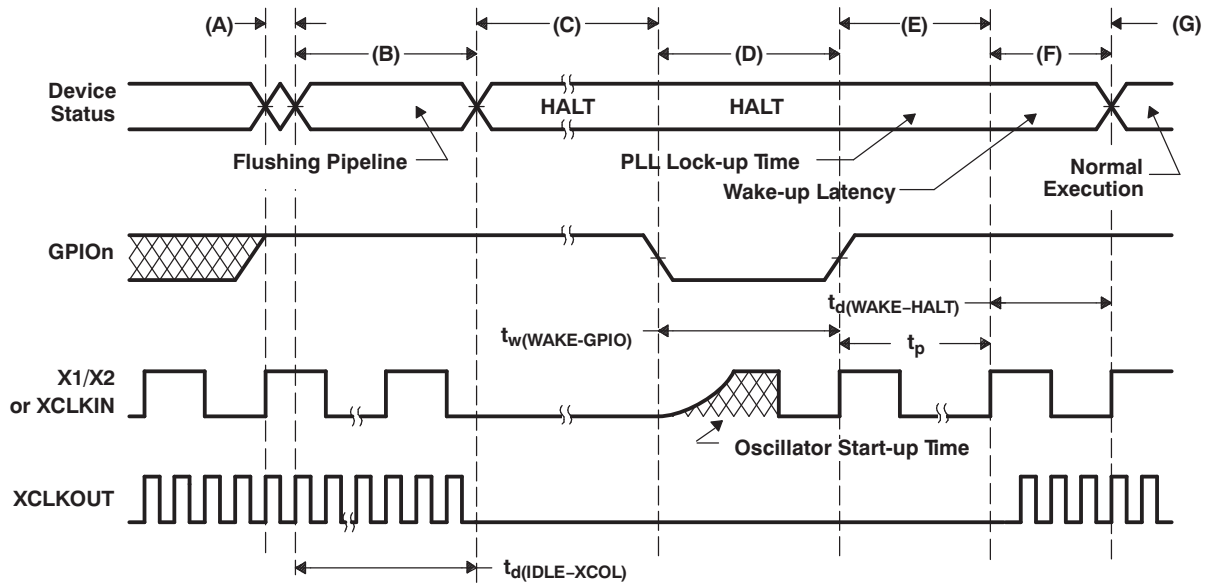

Figure 6-13. STANDBY Entry and Exit Timing Diagram

Table 6-18. HALT Mode Timing Requirements

| | | MIN | NOM | MAX | UNIT |
|-------------------------|---|-----|-----|--|--------|
| $t_w(\text{WAKE-GPIO})$ | Pulse duration, GPIO wake-up signal | | | $t_{\text{oscst}} + 2t_{c(\text{OSCCLK})}$ | cycles |
| $t_w(\text{WAKE-XRS})$ | Pulse duration, $\overline{\text{XRS}}$ wakeup signal | | | $t_{\text{oscst}} + 8t_{c(\text{OSCCLK})}$ | cycles |

Table 6-19. HALT Mode Switching Characteristics

| PARAMETER | MIN | TYP | MAX | UNIT | |
|---------------------------|---|-----|-------------------------|-----------------------|--------|
| $t_{d(\text{IDLE-XCOL})}$ | Delay time, IDLE instruction executed to XCLKOUT low | | $32t_{c(\text{SCO})}$ | $45t_{c(\text{SCO})}$ | cycles |
| t_p | PLL lock-up time | | 1 | ms | |
| $t_{d(\text{WAKE-HALT})}$ | Delay time, PLL lock to program execution resume | | $1125t_{c(\text{SCO})}$ | cycles | |
| | <ul style="list-style-type: none"> Wake up from flash – Flash module in sleep state | | | | |
| | <ul style="list-style-type: none"> Wake up from SARAM | | $35t_{c(\text{SCO})}$ | cycles | |

- IDLE instruction is executed to put the device into HALT mode.
- The PLL block responds to the HALT signal. SYSCLOCKOUT is held for approximately 32 cycles before the oscillator is turned off and the CLKIN to the core is stopped. This 32-cycle delay enables the CPU pipe and any other pending operations to flush properly.
- Clocks to the peripherals are turned off and the PLL is shut down. If a quartz crystal or ceramic resonator is used as the clock source, the internal oscillator is shut down as well. The device is now in HALT mode and consumes absolute minimum power.
- When the GPIO_n pin is driven low, the oscillator is turned on and the oscillator wake-up sequence is initiated. The GPIO pin should be driven high only after the oscillator has stabilized. This enables the provision of a clean clock signal during the PLL lock sequence. Since the falling edge of the GPIO pin asynchronously begins the wakeup procedure, care should be taken to maintain a low noise environment prior to entering and during HALT mode.
- When GPIO_n is deactivated, it initiates the PLL lock sequence, which takes 131,072 OSCCLK (X1/X2 or X1 or XCLKIN) cycles.
- When CLKIN to the core is enabled, the device will respond to the interrupt (if enabled), after a latency. The HALT mode is now exited.
- Normal operation resumes.

Figure 6-14. HALT Wake-Up Using GPIO_n

6.10 Enhanced Control Peripherals

6.10.1 Enhanced Pulse Width Modulator (ePWM) Timing

PWM refers to PWM outputs on ePWM1-6. Table 6-20 shows the PWM timing requirements and Table 6-21, switching characteristics.

Table 6-20. ePWM Timing Requirements⁽¹⁾

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|-----------------|------------------------|----------------------|-----------------------------|-----|--------|
| $t_{w(SYICIN)}$ | Sync input pulse width | Asynchronous | $2t_{c(SCO)}$ | | cycles |
| | | Synchronous | $2t_{c(SCO)}$ | | cycles |
| | | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | | cycles |

(1) For an explanation of the input qualifier parameters, see Table 6-13.

Table 6-21. ePWM Switching Characteristics

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
|-------------------|--|---------------|-----|--------|
| $t_{w(PWM)}$ | Pulse duration, PWMx output high/low | 20 | | ns |
| $t_{w(SYNCOUT)}$ | Sync output pulse width | $8t_{c(SCO)}$ | | cycles |
| $t_{d(PWM)tza}$ | Delay time, trip input active to PWM forced high | | 25 | ns |
| | Delay time, trip input active to PWM forced low | no pin load | | |
| $t_{d(TZ-PWM)HZ}$ | Delay time, trip input active to PWM Hi-Z | | 20 | ns |

6.10.2 Trip-Zone Input Timing

- A. $\overline{TZ} - \overline{TZ1}, \overline{TZ2}, \overline{TZ3}$
B. PWM refers to all the PWM pins in the device. The state of the PWM pins after \overline{TZ} is taken high depends on the PWM recovery software.

Figure 6-15. PWM Hi-Z Characteristics

Table 6-22. Trip-Zone input Timing Requirements⁽¹⁾

| | | MIN | MAX | UNIT |
|-------------|--|----------------------|-----------------------------|--------|
| $t_{w(TZ)}$ | Pulse duration, \overline{TZx} input low | Asynchronous | $1t_{c(SCO)}$ | cycles |
| | | Synchronous | $2t_{c(SCO)}$ | cycles |
| | | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | cycles |

(1) For an explanation of the input qualifier parameters, see Table 6-13.

Table 6-23 shows the high-resolution PWM switching characteristics.

Table 6-23. High Resolution PWM Characteristics at SYSCLKOUT = (60 - 100 MHz)

| | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|------|
| Micro Edge Positioning (MEP) step size ^{(1) (2)} | | 150 | 310 | ps |

- (1) Maximum MEP step size is based on worst-case process, maximum temperature and maximum voltage. MEP step size will increase with low voltage and high temperature and decrease with voltage and cold temperature. Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO function in end applications. SFO functions help to estimate the number of MEP steps per SYSCLKOUT period dynamically while the HRPWM is in operation.
- (2) Between 40 to 50 MHz SYSCLKOUT under worst case process, voltage, and temperature (maximum voltage and minimum temperature) conditions, the MEP step delay may decrease to a point such that the maximum of 254 MEP steps may not cover 1 full SYSCLKOUT cycle. In other words, high-resolution edge control will not be available for the full range of a SYSCLKOUT cycle. If running SFO calibration software, the SFO function will return an error code of "2" when this occurs. See the device-specific HRPWM Reference Guide for more information on this error condition.

Table 6-24 shows the eCAP timing requirement and Table 6-25 shows the eCAP switching characteristics.

Table 6-24. Enhanced Capture (eCAP) Timing Requirement⁽¹⁾

| | TEST CONDITIONS | MIN | MAX | UNIT |
|--|----------------------|-----------------------------|-----|--------|
| $t_{w(CAP)}$ Capture input pulse width | Asynchronous | $2t_{c(SCO)}$ | | cycles |
| | Synchronous | $2t_{c(SCO)}$ | | cycles |
| | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | | cycles |

- (1) For an explanation of the input qualifier parameters, see Table 6-13.

Table 6-25. eCAP Switching Characteristics

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
|---|-----------------|-----|-----|------|
| $t_{w(APWM)}$ Pulse duration, APWMx output high/low | | 20 | | ns |

6.10.3 External Interrupt Timing

Figure 6-16. External Interrupt Timing

Table 6-26. External Interrupt Timing Requirements⁽¹⁾

| | TEST CONDITIONS | MIN | MAX | UNIT |
|--|-----------------|-----------------------------|-----|--------|
| $t_{w(INT)}$ ⁽²⁾ Pulse duration, INT input low/high | Synchronous | $1t_{c(SCO)}$ | | cycles |
| | With qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | | cycles |

- (1) For an explanation of the input qualifier parameters, see Table 6-13.
- (2) This timing is applicable to any GPIO pin configured for ADCSOC functionality.

Table 6-27. External Interrupt Switching Characteristics⁽¹⁾

| PARAMETER | MIN | MAX | UNIT |
|---|-----|------------------------------|--------|
| $t_{d(INT)}$ Delay time, INT low/high to interrupt-vector fetch | | $t_{w(IQSW)} + 12t_{c(SCO)}$ | cycles |

- (1) For an explanation of the input qualifier parameters, see Table 6-13.

6.10.4 I2C Electrical Specification and Timing

Table 6-28. I2C Timing

| TEST CONDITIONS | | | MIN | MAX | UNIT |
|-------------------|---|---|------------------------|-----------------------|------|
| f _{SCL} | SCL clock frequency | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | | 400 | kHz |
| v _{il} | Low level input voltage | | | 0.3 V _{DDIO} | V |
| V _{ih} | High level input voltage | | 0.7 V _{DDIO} | | V |
| V _{hys} | Input hysteresis | | 0.05 V _{DDIO} | | V |
| V _{ol} | Low level output voltage | 3 mA sink current | 0 | 0.4 | V |
| t _{LOW} | Low period of SCL clock | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | 1.3 | | μs |
| t _{HIGH} | High period of SCL clock | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | 0.6 | | μs |
| I _i | Input current with an input voltage between 0.1 V _{DDIO} and 0.9 V _{DDIO} MAX | | -10 | 10 | μA |

6.10.5 Serial Peripheral Interface (SPI) Master Mode Timing

Table 6-29 lists the master mode timing (clock phase = 0) and Table 6-30 lists the timing (clock phase = 1). Figure 6-17 and Figure 6-18 show the timing waveforms.

Table 6-29. SPI Master Mode External Timing (Clock Phase = 0)⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

| NO. | | | SPI WHEN (SPIBRR + 1) IS EVEN OR SPIBRR = 0 OR 2 | | SPI WHEN (SPIBRR + 1) IS ODD AND SPIBRR > 3 | | UNIT |
|-----|----------------------|--|---|------------------|--|----------------------------------|------|
| | | | MIN | MAX | MIN | MAX | |
| 1 | $t_{c(SPC)M}$ | Cycle time, SPICLK | $4t_{c(LCO)}$ | $128t_{c(LCO)}$ | $5t_{c(LCO)}$ | $127t_{c(LCO)}$ | ns |
| 2 | $t_{w(SPCH)M}$ | Pulse duration, SPICLK high (clock polarity = 0) | $0.5t_{c(SPC)M} - 10$ | $0.5t_{c(SPC)M}$ | $0.5t_{c(SPC)M} - 0.5t_{c(LCO)} - 10$ | $0.5t_{c(SPC)M} - 0.5t_{c(LCO)}$ | ns |
| | $t_{w(SPCL)M}$ | Pulse duration, SPICLK low (clock polarity = 1) | $0.5t_{c(SPC)M} - 10$ | $0.5t_{c(SPC)M}$ | $0.5t_{c(SPC)M} - 0.5t_{c(LCO)} - 10$ | $0.5t_{c(SPC)M} - 0.5t_{c(LCO)}$ | |
| 3 | $t_{w(SPCL)M}$ | Pulse duration, SPICLK low (clock polarity = 0) | $0.5t_{c(SPC)M} - 10$ | $0.5t_{c(SPC)M}$ | $0.5t_{c(SPC)M} + 0.5t_{c(LCO)} - 10$ | $0.5t_{c(SPC)M} + 0.5t_{c(LCO)}$ | ns |
| | $t_{w(SPCH)M}$ | Pulse duration, SPICLK high (clock polarity = 1) | $0.5t_{c(SPC)M} - 10$ | $0.5t_{c(SPC)M}$ | $0.5t_{c(SPC)M} + 0.5t_{c(LCO)} - 10$ | $0.5t_{c(SPC)M} + 0.5t_{c(LCO)}$ | |
| 4 | $t_{d(SPCH-SIMO)M}$ | Delay time, SPICLK high to SPISIMO valid (clock polarity = 0) | | 10 | | 10 | ns |
| | $t_{d(SPCL-SIMO)M}$ | Delay time, SPICLK low to SPISIMO valid (clock polarity = 1) | | 10 | | 10 | |
| 5 | $t_{v(SPCL-SIMO)M}$ | Valid time, SPISIMO data valid after SPICLK low (clock polarity = 0) | $0.5t_{c(SPC)M} - 10$ | | $0.5t_{c(SPC)M} + 0.5t_{c(LCO)} - 10$ | | |
| | $t_{v(SPCH-SIMO)M}$ | Valid time, SPISIMO data valid after SPICLK high (clock polarity = 1) | $0.5t_{c(SPC)M} - 10$ | | $0.5t_{c(SPC)M} + 0.5t_{c(LCO)} - 10$ | | |
| 8 | $t_{su(SOMI-SPCL)M}$ | Setup time, SPISOMI before SPICLK low (clock polarity = 0) | 35 | | 35 | | ns |
| | $t_{su(SOMI-SPCH)M}$ | Setup time, SPISOMI before SPICLK high (clock polarity = 1) | 35 | | 35 | | ns |
| 9 | $t_{v(SPCL-SOMI)M}$ | Valid time, SPISOMI data valid after SPICLK low (clock polarity = 0) | $0.25t_{c(SPC)M} - 10$ | | $0.5t_{c(SPC)M} - 0.5t_{c(LCO)} - 10$ | | ns |
| | $t_{v(SPCH-SOMI)M}$ | Valid time, SPISOMI data valid after SPICLK high (clock polarity = 1) | $0.25t_{c(SPC)M} - 10$ | | $0.5t_{c(SPC)M} - 0.5t_{c(LCO)} - 10$ | | |

- (1) The MASTER / SLAVE bit (SPICTL.2) is set and the CLOCK PHASE bit (SPICTL.3) is cleared.
- (2) $t_{c(SPC)}$ = SPI clock cycle time = LSPCLK/4 or LSPCLK/(SPIBRR + 1)
- (3) $t_{c(LCO)}$ = LSPCLK cycle time
- (4) Internal clock prescalers must be adjusted such that the SPI clock speed is limited to the following SPI clock rate:
Master mode transmit 20-MHz MAX, master mode receive 10-MHz MAX
Slave mode transmit 10-MHz MAX, slave mode receive 10-MHz MAX.
- (5) The active edge of the SPICLK signal referenced is controlled by the clock polarity bit (SPICCR.6).

- A. In the master mode, $\overline{\text{SPISTE}}$ goes active $0.5t_{c(\text{SPC})}$ (minimum) before valid SPI clock edge. On the trailing end of the word, the $\overline{\text{SPISTE}}$ will go inactive $0.5t_{c(\text{SPC})}$ after the receiving edge (SPICLK) of the last data bit, except that $\overline{\text{SPISTE}}$ stays active between back-to-back transmit words in both FIFO and nonFIFO modes.

Figure 6-17. SPI Master Mode External Timing (Clock Phase = 0)

| 22 | $t_{v(\text{SPCH-SIMO})}$ | Valid time, SPISIMO data valid after SPICLK high (clock polarity = 0) | $0.5t_{c(\text{SPC})} - 10$ | | ns |
| | $t_{v(\text{SPCL-SIMO})}$ | Valid time, SPISIMO data valid after SPICLK low (clock polarity = 1) | $0.5t_{c(\text{SPC})} - 10$ | | ns |

- (1) The MASTER / SLAVE bit (SPICTL.2) is cleared and the CLOCK PHASE bit (SPICTL.3) is cleared.
 (2) $t_{c(\text{SPC})}$ = SPI clock cycle time = LSPCLK/4 or LSPCLK/(SPIBRR + 1)
 (3) Internal clock prescalers must be adjusted such that the SPI clock speed is limited to the following SPI clock rate:
 Master mode transmit 20-MHz MAX, master mode receive 10-MHz MAX
 Slave mode transmit 10-MHz MAX, slave mode receive 10-MHz MAX.
 (4) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPICCR.6).

- A. In the slave mode, the $\overline{\text{SPISITE}}$ signal should be asserted low at least $0.5t_{c(\text{SPC})}$ before the valid SPI clock edge and remain low for at least $0.5t_{c(\text{SPC})}$ after the receiving edge (SPICLK) of the last data bit.

Figure 6-20. SPI Slave Mode External Timing (Clock Phase = 1)

6.10.6.1 On-chip Comparator/DAC

Table 6-33. Electrical Characteristics of the Comparator/DAC

| CHARACTERISTIC | MIN | TYP | MAX | UNITS |
|---|-----------------------------------|-----|-----|-------|
| Comparator | | | | |
| Comparator Input Range | $V_{\text{SSA}} - V_{\text{DDA}}$ | | | V |
| Comparator response time to PWM Trip Zone (Async) | 30 | | | ns |
| Input Offset | ± 5 | | | mV |
| Input Hysteresis | 35 | | | mV |
| DAC | | | | |
| DAC Output Range | $V_{\text{SSA}} - V_{\text{DDA}}$ | | | V |
| DAC resolution | 10 | | | bits |
| DAC settling time | 2 | | | us |
| DAC Gain | -1.5 | | | % |
| DAC Offset | 10 | | | mV |
| No Missing Codes | Yes | | | |
| INL | ± 3 | | | LSB |

6.10.7 On-Chip Analog-to-Digital Converter

Table 6-34. ADC Electrical Characteristics (over recommended operating conditions)

| PARAMETER | | MIN | TYP | MAX | UNIT |
|--|--------------------------|--------------------|--------------------|-----|--------|
| DC SPECIFICATIONS | | | | | |
| Resolution | | 12 | | | Bits |
| ADC clock | 40-MHz device | | | | MHz |
| | 60-MHz device | 0.001 | 60 | | MHz |
| ACCURACY | | | | | |
| INL (Integral nonlinearity) | 60-MHz clock (4.62 MSPS) | ±2 | | | LSB |
| DNL (Differential nonlinearity) | | ±1 | | | LSB |
| Offset error ⁽¹⁾ | | ±10 | | | LSB |
| Overall gain error with internal reference | | ±10 | | | LSB |
| Overall gain error with external reference | | ±10 | | | LSB |
| Channel-to-channel offset variation | | ±4 | | | LSB |
| Channel-to-channel gain variation | | ±4 | | | LSB |
| ANALOG INPUT | | | | | |
| Analog input voltage ⁽²⁾ with internal reference | | 0 | 3.3 | | V |
| Analog input voltage ⁽²⁾ with external reference | | V _{REFLO} | V _{REFHI} | | V |
| V _{REFLO} input voltage | | ⁽³⁾ | | | V |
| V _{REFHI} input voltage (with V _{REFLO} = V _{SSA}) | | 1.98 | V _{DDA} | | V |
| Temperature coefficient | | 50 | | | PPM/°C |
| Input capacitance | | 10 | | | pF |
| Input leakage current | | ±5 | | | µA |

- (1) 1 LSB has the weighted value of full-scale range (FSR)/4096. FSR is 3.3 V with internal reference and V_{REFHI} - V_{REFLO} for external reference.
- (2) Voltages above V_{DDA} + 0.3 V or below V_{SS} - 0.3 V applied to an analog input pin may temporarily affect the conversion of another pin. To avoid this, the analog inputs should be kept within these limits.
- (3) V_{REFLO} is always connected to V_{SSA}.

6.10.7.1 ADC Power-Up Control Bit Timing

Table 6-35. ADC Power-Up Delays

| PARAMETER ⁽¹⁾ | | MIN | TYP | MAX | UNIT |
|--------------------------|--|-----|-----|-----|------|
| t _{d(PWD)} | Delay time for the ADC to be stable after power up | | | 1 | ms |

- (1) Timings maintain compatibility to the ADC module. The 2802x ADC supports driving all 3 bits at the same time t_{d(PWD)} ms before first conversion.

6.11 Detailed Descriptions

Integral Nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs one-half LSB before the first code transition. The full-scale point is defined as level one-half LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

Differential Nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than ± 1 LSB ensures no missing codes.

Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

Gain Error

The first code transition should occur at an analog value one-half LSB above negative full scale. The last transition should occur at an analog value one and one-half LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following

formula,
$$N = \frac{(\text{SINAD} - 1.76)}{6.02}$$
 it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first nine harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

7 Mechanicals

The mechanical package diagram(s) that follow the tables reflect the most current released mechanical data available for the designated device(s).

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Additions, Deletions and Modifications

| LOCATION | DESCRIPTION |
|--------------------------------|---|
| Section 1.1 | Added enhanced control peripherals to features list |
| Table 2-2 | Modified the descriptions of the X1, X2, and $\overline{\text{XRS}}$ pins |
| Section 3.2 | Modified the memory maps |
| Section 3.3.4 | Modified the Real-time JTAG and Analysis section |
| Section 3.3.19 | Modified the Control Peripherals section |
| Table 3-7 | Modified the peripheral frame 2 registers table |
| Figure 3-6 | Moved and modified the VREG + POR + BOR + Reset Signal Connectivity figure |
| Figure 3-7 | Modified the clock and reset domains figure |
| Table 3-9 | Modified the device emulation registers table |
| Figure 3-4 | Modified the external and PIE interrupt sources figure |
| Figure 3-8 | Modified the clock tree figure |
| Table 3-14 | Modified the PLLCR bit descriptions table and changed the title to PLL Settings |
| Section 3.7.2 | Modified the section on POR and BOR circuit |
| Section 3.8.4 | Modified the Loss of Input Clock section and added to the title |
| Figure 3-11 | Changed the title of the Clock Fail figure to NMI-watchdog |
| Section 3.9 | Modified the Low-power Modes Block section |
| Table 4-1 | Added a column to show EALLOW protection to register tables |
| Table 3-7 | Modified the peripheral frame 2 registers table |
| Section 4.8 | Modified the GPIO MUX section |
| Section 6.1 | Modified the Absolute Maximum Ratings table |
| Section 6.4 | Added the Current Consumption section and all the sections following it |

PACKAGING INFORMATION

| Orderable Device | Status ⁽¹⁾ | Package Type | Package Drawing | Pins | Package Qty | Eco Plan ⁽²⁾ | Lead/Ball Finish | MSL Peak Temp ⁽³⁾ |
|------------------|-----------------------|--------------|-----------------|------|-------------|-------------------------|------------------|------------------------------|
| TMX320F28023DAA | ACTIVE | TSSOP | DA | 38 | 1 | TBD | Call TI | Call TI |
| TMX320F28027PTA | ACTIVE | LQFP | PT | 48 | 1 | TBD | Call TI | Call TI |

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PT (S-PQFP-G48)

PLASTIC QUAD FLATPACK

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-026
 D. This may also be a thermally enhanced plastic package with leads connected to the die pads.

DA (R-PDSO-G**)
 38 PIN SHOWN

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 - Falls within JEDEC MO-153, except 30 pin body length.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
